DON'T KEEP IT A SECRET!

Let us know what exciting new software and systems you are working on. We'll tell everyone else (if you wish). Maybe someone is also working on the same thing. You can work together and get results twice as fast. Or, may be someone else has already done it; no reason for everyone to reinvent the wheel.

Reprint privileges:
Articles herein that are copyrighted by individual authors or otherwise explicitly marked as having restricted reproduction rights may not be reprinted or copied without permission from People's Computer Company, or the authors. All other articles may be reprinted for any non-commercial purpose, provided a credit-line is included. The credit-line should indicate that the material was reprinted from Dr. Dobb's Journal of Computer Calisthenics & Orthodontia, Box 310, Menlo Park, CA 94025.

DATE'M—Please include your name, address, and date on all tidbits you send to us.

TYPE'M—If at all possible, items should be typewritten, double-spaced, on standard, 8½ x 11 inch, white paper. If we can't read it, we can't publish it. Remember that we will be retyping all natural language (as opposed to computer languages) communications that we publish.

PROGRAM LISTINGS—We will accept hand-written programs only as a very last resort. Too often, they tend to say something that the computer would find indigestible. On the other hand, if the computer typed it, the computer would probably accept it—particularly if it is a listing pass from an assembler or other translator.

It is significantly helpful for program listings to be on continuous paper; either white, or very light blue, roll paper, or fan-folded paper. Since we reduce the copy in size, submitting it on individual pages forces us to do a significant amount of extra cutting and pasting. For the same reason, we prefer that you exclude pagination or page headings from any listings.

Please, please, please put a new ribbon on your printer before you run off a listing for publication.

In any natural language documentation accompanying a program listing, please refer to portions of code by their address or line number or label, rather than by page number.

DRAWINGS & SCHEMATICS—Please draw them significantly larger than the size you expect them to be when they are published. Take your time and make them as neat as possible. We do not have the staff to retouch or re-draw illustrations. Use a black-ink pen on white paper.

LETTERS FOR PUBLICATION—We are always interested in hearing your praise, complaints, opinions, daydreams, etc. In letters of opinion for publication, however, please back up any opinions that you present with as much factual information as possible.

We are quite interested in publishing well-founded, responsible evaluations and critiques of anything concerning hobbyist hardware or software, home computers, or computers and people.

We may withhold your name from a published letter if you so request. We will not publish correspondence, however, which is sent to us anonymously.

We reserve the right to edit letters for purpose of clarity and brevity.

ADVERTISING—As long as we can afford to do so, we will not accept commercial advertising. This "keeps us honest" when we pursue the role of consumer advocate.
Policy Statement:

Handling of consumers' complaints regarding vendors' products & services

by the Editor

As our regular readers are aware, we have pursued a course of active consumer advocacy ever since we began publication. In fact, one of the reasons we refuse to carry paid advertising is to maintain the viability of our statements and comments regarding products and services being offered to the computer consumer. After some months of publishing compliments and complaints about vendors' offerings, we have slowly evolved a policy regarding the handling of consumer complaints which we believe will be fair to both the consumer and the vendor, to wit:

We solicit both compliments and complaints concerning vendors, from the hobbyist community. In either case, these comments should be explicit, and contain as much detail as may be appropriate. In the case of complaints, particularly those involving service, we will contact the vendor, discuss the complaint with him, and request that an explicit response from him be forthcoming within a reasonably short period of time. If the response is written, we will request that a copy of it be forwarded to the originator of the complaint.

If we receive a response within the time period we specify, and the response appears to us to adequately deal with the complaint, then we will do nothing more about the complaint. If we fail to receive a response within a reasonable period of time, or the response is vague, ambiguous, or otherwise fails to deal with the specifics of the complaint, then we will probably publish the complaint (and probably the response, as well) in the next available issue of Dr. Dobb's Journal.

If we receive complaints about poor design of some item of hardware or software, and it is our engineering and systems judgment that they are valid, then we may publish the complaint without first contacting the vendor. If there is any question about the validity of the complaint, we will contact the vendor or manufacturer as outlined above.

We will take this path of action only in the case of written complaints that explicitly specify the problems.

In the case of compliments and praise, we will publish it whenever it seems appropriate to do so. It is almost certainly appropriate when we receive multiple complimentary remarks about the same product or service, coming from different parts of the country.

A Note and Warning for Hobbyists & Vendors

HURRAY & BEWARE:
EVERYBODY'S JUMPING ON THE CONVENTION BANDWAGON
by Jim C. Warren, Jr., Editor, Dr. Dobb's Journal

So far, the computer hobbyist conventions have been entirely run by hobbyists. As such, they have been well-oriented to hobbyist needs and interests and have been really exciting to most of those who attended them. Also as a result, however, they have generally been less organized and more haphazard than is the case with a "professionally run" convention. They haven't furnished as much as they could (and have often been a hair-pulling frustration to exhibitors), but, what they lacked in smooth operation, they more than made up for in exuberance and enthusiasm.

Now, however, some professional convention organizers are starting to get into the act. With a proper attitude, and with close cooperation and leadership from the hobbyists, these "pros" can help make a good convention even better. They can smooth out the rough spots and tie up the loose ends. However, at least a few of them don't appear to give a damn about the hobbyists; they seem interested only in the maximum amount of profit for the minimum effort. In this case, I would say that "pro" stands for promoter with its worse possible connotation.

I became aware of this whole thing at the Atlantic City convention, because I passed out preliminary announcements of the First West Coast Computer Faire to be held in the San Francisco Bay Area, next Spring. As a result, I had half a dozen people contact me to say that, also, were planning computer hobbyist conventions. I found this both exciting and disturbing. It was exciting to see that the personal computing movement has grown sufficiently that a number of people considered it worth their time and effort to organize a convention in their region. It was disturbing in that (1) I found that almost no one was paying any attention to what anyone else was planning, and (2) I encountered at least a few people who appeared to be interested in it strictly for profit without the slightest interest in benefiting the hobbyists. I think that the former can cause less-than-excellent conventions and gross confusion and irritation on the part of the vendors, and the latter can produce, at best, "cheap shows."

Sooner or later, the vendors will probably put together an association that will maintain a calendar of such events. Until that happens, there are some things that can be done by people considering holding a conference or convention to avoid (or at least know about) calendar conflicts.

1. They can phone me at People's Computer Company, (415) 323-3111. I will be happy to tell them of all the conferences I know of, and will maintain a Calendar of all hobbyist conventions of which I am informed.

2. Periodically, Dr. Dobb's Journal will carry a complete listing of that Calendar information. The list that follows is the first such listing.

3. They can contact Smith Dorsey, the Chairman of the ACM's Conferences & Symposia Committee. Smith maintains one of the most complete calendars of computer-related events available, including both ACM and non-ACM meetings. He can be reached at Rockwell International, Dept. 503/034, 3370 Mira Loma Ave., Anaheim, CA 92803, (714) 632-1391.

4. They can check the Events Calendar published each month in the Association for Computing Machinery's Communications of the ACM, and the Institute for Electrical and Electronics Engineers (IEEE) Computer Society magazine, Computer. This will at least point out possible conflicts with meet-
ings organized by the professional and engineering societies. There are also some things that can be done to avoid being disappointed by the "cheap shows" (whether you are a hobbyist or a vendor).

1. See whether the hobbyist groups located in the area of an advertised convention are sponsoring or actively participating in the meeting. If they are, you can expect them to be listed in the advertisements. If they are not listed, you should assume that they are not involved, and that the "convention" is really little more than a trade show.

2. See whether a significant conference activity is part of the convention, along with the trade show/exhibition. If there are advertisements should note that there will be a number of talks, panel sessions, seminars, etc. If they don't, you should assume that it is primarily a trade show—and expect nothing more than that, if you attend.

Note: This list excludes a number of conventions directed towards computer professionals that are expected to have at least nominal activity in the area of personal and hobby computing. Although the '77 NCC is primarily for computer professionals, its Personal Computing Section will be a major activity with a number of significant sessions and events planned for personal computer enthusiasts.
A CONSUMER’S REPORT ON iCOM’S FLOPPY DISC SUBSYSTEM

Dear Editor,

September 1, 1976

I read with interest, “The Time for Floppy’s is Just About Now,” in DDJ, 8/76. I too think a floppy peripheral provides a highly desirable mass storage device, not only for homebrews but for industrial micros and minis as well.

In particular, I would like to provide some answers from my own experiences, to the questions you had regarding the iCOM floppy system. I bought a single drive system in August 1975. At that time they had not yet introduced their Frugal Floppy but they allowed me to purchase just the controller-formatter, model CF360, Mux card (-20) and cable set (-22). They then told me exactly how to buy the mating Pertec drive and mating Adtech power supply, giving me part numbers and names of people to contact. At the same time, they mailed me their Interface Manual and their Schematics and Logic Diagrams to me. By the time all the equipment arrived, I had already purchased the necessary 2 PIA’s (Peripheral Interface Adapter) for $15.00 each, connected them to my Motorola M6800 Evaluation Module board, and provided a connector to mate with the formatter-controller. Within about an hour, primarily required to add a fuse and power cord to the power supply and figure out which cables connected where, the system was all connected up and I was trying out the subroutines in my own version of a software driver. All the necessary interconnecting cables and connectors but one had been provided as part of the formatter-controller purchase. The manuals had provided suitable information about this cable so I had it ready and waiting too. (It is now included with the Frugal Floppy.)

Their documentation was thorough and accurate. Of the fourteen floppy commands that can be issued to the formatter-controller, I managed to correctly implement 12 of them in my driver without problems. It took me another week to debug my READ routine and the remaining two commands so that I was reading data and not status. I still had one problem left, but when I called iCOM, Terry Zimmerman and Bob Brusse informed me how to interpret IBM format, and my problems were over. In addition, Bob went over the entire Logic Diagram and added all the signal names that had been omitted from various portions of the circuit and included two gates that had been added to the PC boards but not the Logic Diagram. During the year since, the Microcomputer/Floppy has been interfaced to a minicomputer as an intelligent peripheral, and it was found desirable to add another disk drive. I ordered another Pertec drive this time from iCOM, with an additional Mux board, and when it arrived and was unpacked, I simply attached it to the connectors that had come with the original system, and was able to use either drive just as easily as using the single drive. Unfortunately, the fuse on the power supply blew out several times. A call to iCOM revealed that we had been too conservative in sizing the fuse initially so we increased its capacity and added the recommended fan to provide cooling and now have an effective, dependable system.

Two additional programmers have “cut their teeth” on this system. One added routines to the core-resident driver including an automatic initial-program-load (IPL) feature.

PERTEC (FLOPPY MAKER): BUYS iCOM (CONTROLLER MAKER), MAKES WATS LINE AVAILABLE TO CUSTOMERS

Pertec, a manufacturer of floppy disc drives for some years, has just completed purchase of iCom, the Southern California systems house. iCom has been marketing a floppy disc controller and operating system for Pertec drives since last spring, and has been actively cooperating with computer hobbyists.

Unrelated to this purchase, Pertec has announced installation of WATS-line (toll-free) telephone service for use by its customers and field service personnel. This 800-area code number allows you to call the factory trouble shooters, without cost.

Note: We just phoned WATS Information and found that the Pertec WATS number is (800) 423-5156 . . . but is accessible only outside of California.

USED TELETYPES & TERMINALS

National Teletypewriter Corp. (207 Newtown Rd., Plainview, NY 11803, (516) 293-0444) is an ongoing dealer in used computer terminals and a variety of models of teletype.

The other implemented a partially disk-resident operating system that makes the 1K of microcomputer RAM memory appear to be about 4K, by using overlay techniques and program chaining.

Throughout it all, the floppy system has always functioned properly. The compatibality of the IBM format used was tested as follows. The minicomputer collected digital data, it was passed to EBCDIC and recorded on the diskette. The diskette was then loaded into an IBM 3540 peripheral on our IBM 370. The IBM 370 was then able to read and print the data as if the diskette had been recorded in the 3540. Similarly, IBM 3540-recorded diskettes were loaded into iCOM floppy system, read by the M6800, translated to ASCII, and used as data by the driver routines.

Since then, we have ordered a Frugal Floppy and a mating power supply ($250 for the power supply) and are contemplating purchase of a third system. These negotiations were handled by Alan Garfein who provided information and advice not only about iCOM equipment but was most helpful in providing leads to other related equipment. In summary, the equipment has been highly reliable and performed according to specifications, the documentation was well-written and complete, and the personnel were knowledgeable and helpful. We expect to be getting FDOS I, editor, and assembler with the Frugal Floppy and then we will be able to gain experience with iCOM software as well.

Sincerely,
Chuck Felber

Dr. Dobb’s Journal of Computer Calisthenics & Orthodontia, Box 310, Menlo Park, CA 94025
Some Personal Observations on Personal Computing '76

Jim C. Warren, Jr., Editor

Through the prodigious efforts of John Dilks, Davy Jones, and Jim Main (and with considerable help, guidance and support from Carl Helmers and BYTE Magazine), the August 27th-28th Personal Computing '76 Consumer Trade Fair was a great turn-on! So much was going on that I had only three to four hours of sleep per night, and even then, I missed some gatherings I would like to have attended. Details of particular note:

Statistics, first: About 4,500 computer enthusiasts and curiosity seekers attended the two-day convention. There were slightly over 100 exhibitors, and about 50 talks, panel sessions, and seminars. The banquet on Saturday night turned out over 300 people (in spite of its hefty $15 price tag).

We blew it. Contrary to the “reliable rumor” we published in our August issue, Heathkit was not one of the exhibitors. We understand, however, that Heath purchased a block of 16 tickets to the convention. Lou Frenzel, their Director of Computer Products was there. And, he reportedly was overheard saying that Heath would have a kit out “before Spring.” So much for rumors mongered.

Idle gossip had it that MOS Technology was being bought by Commodore Calculators. (So what? They will undoubtedly continue to turn out hot products.)

I am delighted to publish another correction to information in our August issue: We noted (incorrectly) that the fine print of the literature concerning Matrox VRAM’s (Video RAM) indicated that a minimum order was 100 units. Their rep, Lorne Trottier, dropped by to say “hi,” and told us that the stock items we had listed in that August article are available in unit quantity for the prices we quoted. The 100-unit minimum pricing referred only to custom-built units. Therefore, take another close look at ’em. They have a 256 x 256 black-and-white graphics display for $630, as well as some interesting 64 and 80-character alphanumeric VRAM’s (ASCII in, video out). That’s Matrox Electronic Systems, Box 56, Ahuntsic Stn., Montreal, Quebec H31 3N5, (514) 481-6838.

I am also delighted to report a correction to comments contained in a letter that we published in our June/July issue. In that letter, one of our readers stated that MITS Computer Notes would only be available by subscription after the first of the year. Dave Bunnell, the publisher of Computer Notes, announced at the banquet that this was incorrect (explicitly referencing the letter) and indicated that Computer Notes subscriptions would be available without cost, permanently. We applaud this fair-minded and sensible policy and apologize for publishing inaccurate information [note the Policy Statement on Complaints, published elsewhere in this issue.]

National Semiconductor was present and told me that they now have Tiny BASIC for their SC/MP microprocessor. It is available in paper tape form or in 3K of PROM. Incidentally, their SC/MP kit with 256 bytes of RAM, and 512 bytes of ROM including their KITBUG monitor is available for $99. In less than four months, Hash Patil said they had sold over 8,000 of these kits.

Someone mentioned this interesting tidbit: Alexander Graham Bell was not a technical type. Rather, he was an artist. In fact, he was a member of the National Academy of Design which, at that time, was a very prestigious national society.

I should mention Leda Alpert, the woman who put together the super low-cost travel package that helped a number of west coasters (including myself) afford to attend the convention. She almost worked her Southern California tan to the bone putting that mess together.

At least in my case, her agency (Travel Co-Ordinators, Inc., Los Angeles) probably lost more than it made. We must have spent half a dozen long-distance phone calls, haggling over my eccentric travel desires. But ultimately, she put it together. Furthermore, she was at the show to troubleshoot travel problems for her clients . . . which was helpful to a couple of people.

I had the good fortune to meet Neil Colvin, the software type with Technical Design Labs of Trenton, NJ. Keep an eye on that crowd; they are doing some great things with their Z-80 system. Among other things, Neil said they already have a macro assembler modeled after DEC’s MACRO-10 and using MACRO-11 syntax that produces relocatable code. They have a loader that accepts relocatable load modules. They have a BASIC that runs in 6.5K bytes and accepts Altair BASIC source code. They have a FORTRAN compiler very near completion (aww shucks; I thought that dinosaur was dead). And, at the time I spoke with him, he had just finished transporting a portable PASCAL compiler over to the Z-80. At that time, it took 32K bytes of grossly inefficient code (as portable software is prone to do), and Neil was starting to go through it and optimize it. The PASCAL compiler generates PCODE as output, which requires an interpreter (portable PASCAL had much the flavor of “portable” Tiny BASIC). Neil had managed to crowd the PCODE interpreter in one kilobyte on the Z-80. Also, he said they are working on a “word processor.”

At the head table at the banquet, I was delighted to find myself sitting next to John Whitney, the computer graphics artist of international reputation, who was the last speaker at the banquet. As usual, he closed it with an absolutely fascinating exhibition of some of his computer-generated films. He is a most fascinating man, for his ideas, his art, and his exuberant and vibrant outlook. If you ever get a chance to hear him speak, or see his films, don’t miss it! Incidentally, he travels so much that he has two watches on his watchband; one gives the local time, and the other gives “home” time for the west coast.

I saw the first issue of the much-advertised Microtrek magazine. It had 64 interior pages, of which less than nine were advertising. Almost five pages were devoted to “Just Getting into Microprocessors? Odds Are, You’ll End Up With a Kit,” reprinted from Electronic Design. The rest included: a ten-page article on the “KIM-1 Microcomputer Module,” five pages devoted to a “Super-Simple Cassette Interface,” Part I of an “Introduction to Assembly Language Translation” (eight pages including a glossy), almost nine pages concerning “Better Programming Though Flowcharting and Documentation,” four pages of details for an M6800 “Software Leader,” and a nine-page “Buyer’s Report: The IMSAI 8080 Computer Kit.” I got the impression that it was planning on being a “general content” magazine, just like Byte, but possibly with a
lower level of expertise expected of its readers. However, when I identified myself to the Editor and asked him what the focus of Microtrek would be, he said it was going to concentrate on software. Furthermore, some editorial notes in the first issue state that he is especially seeking articles on medical applications, display applications, floppy disc systems, computer control of electro-mechanical devices, pattern recognition systems, bit-sliced computers, and APL. So, I don't know where Microtrek is headed, but I am interested in seeing the future issues.

Some interesting tidbits gleaned from Chad Harris, Club and Training Manager for the American Radio Relay League (ARRL): There are 281,000 ham operators, right now, and they expect 30,000 more by the end of the year. Their average investment in ham gear exceeds $1K. Only about 1% built all of their own gear; the rest built kits or bought turnkey systems. And . . . Chad estimated that approximately ¼th of the hams are seriously interested in amateur computing; that's more than 70,000 potential computer phenoms!

Quoth one of the banquet speakers, alluding to computer foul-ups: “Failure to receive this bill is not an excuse for nonpayment.”

A surprise award for Computer Hobbyist of the Year was given to Saul Libes, the leader of the Amateur Computer Group of New Jersey and one of the major organizers of personal computing activities on the East Coast.

Someone had a little booth in the Trade Fair portion of the convention and was selling digital clock kits. By Sunday afternoon, he had sold out, packed, and gone home.

IBM was/wasn’t an exhibitor. (The following story came from John Dilks and is retold with his permission). In the early planning stages of PC '76, John contacted IBM and asked them if they were interested in being an exhibitor. Initially, he received no response. Then, IBM decided they were interested, sent in their exhibitor registration fee, and indicated they would be there. So, as part of the promotion of the convention in some of the publicity releases, John (reasonably) mentioned IBM along with a number of others as being expected exhibitors. Shortly before the convention, IBM called up and said they wanted to cancel out. John said, “No way.” IBM said he could keep the registration fee and rent the booth space to someone else. John refused. Then IBM wanted to get another vendor, on their own, and let him take the space. At that point, John told 'em that, no matter what IBM did, they were going to have the booth they had committed for, and it was going to have an IBM sign on it, whether they were there or not. Well, IBM showed up, refused to take the booth, but set up some of their gear in one of the hotel suites and placed a directional sign in the booth (strange people, those maxi makers). In one of the final verbal exchanges between John and an IBM rep, Dilks said, “You know, you people have your heads in the clouds watching for the money to blow by. You ought to look down on the ground and find the bucks laying at your feet.” [Quote verified by John.]

Bob Jones, who has been the publisher of SCS Interface, has chosen to go his own way. He was distributing the August issue of his new publication, called Interface Age. [Incidentally, the last we heard, SCS is planning on continuing to put out their own publication which will be called SCS Interface.]

I spent a pleasant evening with Ron Davies and Roald Evensen, two of the principals in Marketing Ventures, Inc., which is putting together the TechniHobby shows [see “Hurray & Beware . . .”, another article in this issue]. I was favorably impressed by them. They were low key, “up front,” and seemed to have some good ideas. Basically, they were planning on their Technihobby shows being trade fairs covering not only computer hobbyists, but also ham radio and radio-controlled models. In this way, they expect to encourage considerable “cross-pollination,” particularly from the ham crowd into computer. They indicated that they were planning on cooperating with local hobby groups. They also had some innovative ideas for assisting small vendors who couldn’t afford to travel all over the nation exhibiting their wares. They also publish an excellent trade newspaper, Mid-Atlantic Electronics. I got around to reading it on the way back to the West Coast and found that I tore out almost half the pages to keep in my technical reference files. They are at 5012 Herzel Pl., Beltsville, MD 20705.

I heard that the National Security Agency has an in-house club of computer amateurs that has over 100 members.

The Chesapeake Microcomputer Club appears to be an East Coast counterpart of the Southern California Computer Society. It already has Chapters in Baltimore, Columbia, Wheaton, Washington, McLean, Reston, and Richmond.

Wayne Green and John Craig were there with 73 Magazine and their new computer hobby mag, Kilobyte. [See John Craig’s article elsewhere in this issue.]

Votrax was another exhibitor well worth noting. They have been making speech synthesis systems for several years. Last Spring, we contacted them and encouraged them to enter the hobbyist market with a low-cost speech-synthesis kit. I am delighted to report that they were handing out a press release detailing such a kit for $750, with first deliveries planned for early 1977. [See February, March, May and September issues of DDJ for more details.]

I heard some preliminary but very exciting comments about a general-purpose string-processing language that is about to become available, based on Strachey’s GPM and McIlroy’s M6.

Ted Nelson was there with his Itty Bitty Machine Company of Chicago, and 7’-high stacks of IMSAI’s as a backdrop. We happened to share the same tables for several meals . . . a most interesting guy. He told me something of his progress on Xanadu, a very exotic electronic library and information facility (described in one part of his book, Computer Lib); a fascinating project that appears to be nearing reality. If you haven’t heard about it, better look it up. You are likely to be hearing about it before long. He is making heavy use of Calvin Mooers’ TRAC (licensed, proprietary name) language, and expects to market the software for $100 (with, of course, an agreed upon royalty being paid to Mooers).

Carl Helmers gave me this hot news item for DDJ (and I took it, hook, line, and sinker): The Amalgamated Clothing Workers Union is considering unionizing programmers. They have decided they ought to do so since they heard that programmers make software. [Byte is too proud to publish it, but we’re just plain folks, out here.]

And with that . . . I better quit.
San Francisco Bay Area finally gets it together

First West Coast Computer Faire

Jim Warren, Editor, Dr. Dobb's Journal

The first microprocessor was invented in the San Francisco Bay Area. One of the first computer clubs to be formed is located in the Bay Area. The Bay Area has the second largest such club in the U.S. The San Francisco Peninsula has a greater concentration of semiconductor and microprocessor manufacturers than any other area in the Western Hemisphere.

Yet, it has never had a conference or convention concerned with personal and home computers, in spite of the fact that three such conventions have met with great success and enthusiasm in the East and Midwest. Well, the San Francisco crowd has finally gotten it's act together. A convention of major proportions is scheduled for next April 15th through 17th, 1977.

The convention—called The First West Coast Computer Faire—will be held in the largest convention facility in Northern California, the Civic Auditorium in San Francisco. The two-and-a-half day event will include a Conference that will offer 50 to 100 different technical and tutorial sessions, several banquets and luncheons with major speakers, and an Exhibition that should have over 200 exhibits. Based on the location, the amount of planning and organization, and the experience with the other hobbyist conventions, 7,000 to 10,000 people are expected to attend.

The Computer Faire is being co-sponsored by a number of computer groups and educational organizations including: The Homebrew Computer Club The Association for Computing Machinery, Peninsula Chapter Stanford University's Electrical Engineering Department People's Computer Company The Community Computer Center The Amateur Research Center and a number of other organizations are considering becoming co-sponsors as this article is being written.

The Conference portion of the Faire will include everything from formal papers and "heavy talks," through informal "shirtsleeve raps." It will also include a number of panel discussions, working sessions, and presentations of homebrewed computer projects. Though planning is still in its early stages, several exciting Conference Sections are already taking shape, some of which are "firsts" for the personal computing movement.

One such Section is that concerned with Personal Computers for Education. It will focus on educational uses of computers in the home and elementary and secondary school, as well as in one-computer/one-user situations in colleges and universities.

Another "first" is the Conference Section on Microprogrammable Microprocessors for Hobbyists. Presentations in this Section will include designs and kits for hobbyists who wish to have systems in which they can "customize" their processor's instruction set.

Sections are also being planned for Computer Music, Computer Graphics and Animation, Personal Computing for the Handicapped, and many other exciting subject areas.

There will be a number of panel sessions and working groups concerned with hardware and software standards. These will include Digital Cassette Tape Standards, Bus Design Standards, Peripherals Interface Standards, Software Modularization for Program Portability, and so on.

There will also be information exchange sessions for Club Officers, Newsletter Editors, and Conference Organizers. Additionally, several "social centers" will be set up around the auditorium for sittin', sippin', and gossipin'.

An exhibition of homebrewed projects and systems is also planned. Assuming that there are sufficient entires to make it interesting, these projects will be judged, and prizes and awards will be presented for the best systems. Nominal Grants-in-Aid will be made available on a refereed basis to some hobbyists living a significant distance from San Francisco who would like the opportunity to exhibit their homebrewed projects. These Grants will be to assist with the expense of shipping the systems to be exhibited.

Most of the banquet plans have yet to be solidified, however, one banquet speaker has already been chosen. He is Professor Henry Tropp who has spent almost three years as the Principal Investigator in the Computer History Project jointly sponsored by the Smithsonian Institution and the American Federation of Information Processing Societies. In this capacity, Professor Tropp has traveled quite broadly, conducting in-depth interviews with most of the "old timers" who created and invented the computer science and technology that is the basis for today's computers. Dr. Tropp is a quite fascinating speaker, and will be relating a number of stories concerning the personalities, foibles, mistakes, accidents, and eccentric technology of those early days of computers.

The Exhibition portion of the Faire will include exhibits by almost every manufacturer and vendor who is in any way interested in the personal computing community. These vendors have shown great enthusiasm for the Faire; many committed to being exhibitors as soon as they heard about it. In the first three afternoons of contacting possible exhibitors, the following have already indicated they expect to participate:

- National Semiconductor
- American Microsystems Inc. (AMI)
- MOS Technology
- Zilog
- Southwest Texas Products
- Apple Computers
- Technical Design Labs
- Polymorphic Systems
- Gromemo
- OSI
- Microcomputer Associates
- STM Systems
- Quay
- Project Support Engineering
- Computer Converser
- Shugart Associates
- iCom
- Action Audio Electronics
- Byte
- Interface Age
- Dr. Dobb's Journal
- People's Computer Co.
- Kilobyte
- 73 Magazine
- Microcomputer Digest
- Osborne & Associates
- Processor Technology
- Solid State Music
- National Multiplex
- Monolithic Systems
- Percom
- Cal Computer
- Associated Electronics Co.
- Byte, Inc.
- CompuMart, Inc.

(Continued on next page.)
The September 2, 1976 issue of Electronics describes two new peripheral support chips that may prove useful to hobbyists.

On page 133 is a description of the MN3020 8-bit D/A converter chip from Micro Networks Corp., 324 Clark Street, Worcester, MA 01606. The 18-pin DIP includes an internal reference and an amplifier for the analog output. Priced at $30, the unit is TTL compatible and should be useful for music and speech synthesis applications.

Page 151 describes a new character generator chip from National Semiconductor Corp., 2900 Semiconductor Drive, Santa Clara, CA 95051. Designated the DM8678, the 16-pin DIP includes all circuits needed for parallel-to-series shifting, address latching, and character and line spacing. Priced at about $15 in lots of 100, the bipolar device could simplify the design of video display boards used by hobbyists.

NEW CHIPS OFF THE OLD SUBSTRATE

by Jim Day

The September 2, 1976 issue of Electronics describes two new peripheral support chips that may prove useful to hobbyists.

On page 133 is a description of the MN3020 8-bit D/A converter chip from Micro Networks Corp., 324 Clark Street, Worcester, MA 01606. The 18-pin DIP includes an internal reference and an amplifier for the analog output. Priced at $30, the unit is TTL compatible and should be useful for music and speech synthesis applications.

Priced at about $15 in lots of 100, the bipolar device could simplify the design of video display boards used by hobbyists.
AN EXCELLENT, POINT-BY-POINT RESPONSE TO COMPLAINTS ABOUT THE DIGITAL GROUP

Dear Mr. Warren,

August 24, 1976

I would like to take this opportunity to thank you for the kind words and your support in Dr. Dobbs Journal. As you know, Dr. Suding and the Digital Group have tried to be equally supportive of your efforts and of course will continue to be so.

In your August issue, you raised some very valid points about what we are trying to do and how well/not-well we are succeeding. Your assumptions were partially valid on the current situation and I would like to address them one-by-one. [The following three quotes were editorial comments published in the August article.]

1. “Customer interest in Digital Group products has exceeded their initial capacity to respond in a manner they would like.”—obviously true.

2. “They are aware that they have a problem and are doing everything they can to expand their customer service department and procedures.”—boy, are we aware of the problem!

3. “It is their wish to maintain an operation of unusually high integrity and responsiveness to their customers.”—Exactly.

Agreeing with you is OK as far as it goes, but what are we DOING? Here are the actions we have taken to rectify the situation.

1. We have expanded our facility from 100 square feet to over 7000.
2. Our number of full time people has expanded from 6 to 16 plus part time as needed.
3. We have quintupled our investment in inventory (which was not trivial to begin with).
4. Of the new personnel, 2 went directly to customer service on a full time basis, effectively tripling our capability there.
5. We are in the process of automating our operation (a long overdue step) so that we can respond to order status more appropriately and do such things as acknowledge receipt of an order, keep better track of any shortages, and keep people informed if their order hits any unexpected snags.

All of these items have been implemented currently and you should begin to see their results soon. We are doing everything we possibly can to “dig out from under” and expect to be in very good shape soon.

Next item: You did print a couple of complaints about the servicing we were providing a couple of months ago. I find no objection whatsoever against complaints when they are on target, but I wish that just once a manufacturer would be given a chance to respond before you go to press—not censor, as that would impinge your integrity—but at least a chance. [We have. See editorial in this issue.] The manufacturer is always automatically cast as the heavy against the little guy and does not dare respond. Please pick up the telephone and call me directly (collect, of course) so at least I can look into the problem and fix the situation. You would then be doing everyone a service by getting action and would still be able to print whatever you felt was appropriate. [A reasonable request. Herewith adopted as Journal policy.—JCW]

On the two items [Page 37, August issue]:

Christopher Hovey. Our turnaround time on servicing is now down to less than a week and rarely, if ever, has exceeded 2 weeks. Of course, Mr. Hovey is at an APO address and normal one-way shipment takes 3 weeks or longer. Amazingly enough, he’s been waiting a full month for his equipment to go by boat to wherever overseas he is stationed. The latest information we have is that he is indeed up and running. [My error. I should have spotted the APO address and noted that a one-month turn-around was reasonable.—JCW]

Robert Gerald. This one’s a pip. Yes, he is quite right that we got some mis-labeled parts from Motorola that did indeed generate upside-down characters. About 10 actually got out our door, and to my knowledge, all have been replaced in most cases before the kit builder even had his kit built. However, his complaint is misleading concerning the replacement of his chip. We shipped him a replacement the day after he placed his call, irrespective of Gus’s comment (which was not true and very ill-advised—one of his bad days obviously). You will note that the date on Mr. Gerald’s letter is the very next day. Now, the post office is doing pretty well, but not that well. Ah, but there’s more. You will notice that after our repeated requests to send in his board, Mr. Gerald finally sent it in with a cover letter on July 31 [Copies of correspondence were enclosed.—JCW]. I’ve also included a copy of our service record for the unit and what we discovered—misplaced part, destroyed character generator, and a solder bridge. We returned his kit on August 12, up and running, with no charge. If that’s “abandoning any kind of customer service to previous purchasers,” I guess there’s nothing more I can say. [We agree.—JCW]

Well, I hope I’ve made my point. As usual, there are 2 sides to every situation, and all I can hope for is that you might be able to do a little checking on what’s really behind the letter before printing.

Sincerely,

Richard C. Bemis, President
The Digital Group, Box 6528, Denver, CO 80206
(303) 861-1886

Editor’s Note: Mr. Bemis also included some notes about a delay in shipment of DG’s Z-80 kits. The problem has been cleared up (as of September 6) and they expect to fill all Z-80 orders within three weeks of receipt.—JCW
CONSUMER NOTES ON DIGITAL GROUP & TINY BASIC

Dear Jim,

Sept. 7, 1976

Since I wrote you last I have received an 8K board, Tiny BASIC and a C-104 superscope cassette player from Digital Group.

4/30/76 Order placed
5/10/76 Tiny BASIC and game tapes received
6/1/76 8K and Cassette deck received

UPS messed DG up by going on strike, so I reminded DG about my order a week after UPS went back to work. The 8K board went together in 3 1/2 hours including checkout and installation. Worked perfectly.

The "Tiny BASIC" (TB) tape was defective and they sent me another. Their soft ware is a little sloppy but it is very inexpensive and does work, $5.00 for TB.

The C-104 works great but I'm sure it's possible to buy it cheaper somewhere else. I wanted it in a hurry. A good feature is its variable speed control. It allows a person to use tapes recorded on different players even if their speed was a little off. The tapes from DG have been running a little slow on my system.

My plans are to work on SCELBI's "SCELBAL" and 8080 assembler programs. Tiny BASIC felt restrictive as soon as I tried to apply it in physics problems. Integer arithmetic requires scaling.

Oh, by the way, the biggest disadvantage of DG's TB is they send no listing or include no software tools for modifying it. Fortunately they tell you how to use it. No listings are sent with their games. TB was set up for TTY and not for 32 column TV, a disadvantage.

Keep up the good work.

Yours,

Ed C. Epp

SOLAR ENERGY COSTS DROP 50% IN 18 MONTHS

Remember how the "nuclear people" were predicting, in last year's California initiative battle, that solar energy would remain uneconomical for the rest of the 20th Century? Well, the September 2nd issue of Electronics magazine carries a report of an announcement by ERDA (Energy Research and Development Administration) officials, stating that costs of photo cells designed for solar energy use had dropped from $30/watt to $15/watt within the last year and a half.

[And: Photocells aren't even the best way to obtain reliable electrical power from the sun. There are some excellent solar-thermal alternatives, requiring no significant technological breakthroughs that can provide 24-hour electrical power without requiring electrical storage for night-time service.]

makes a great kit, and offer praise to them for their relatively inexpensive tank-like kit.

In the next year or so I hope to expand to about 20K of RAM. I also plan to get 8K and 4K BASIC along with IMSAI's self-contained system on PROM. After that comes a hardcopy printer and several more cassettes for a Tarbell interface board.

The IMSAI kit is great and I recommend it to anyone who wants a microcomputer, but doesn't want to wait for an ALTAIR. Being relatively new like they are, IMSAI has quite a kit.

PCC Research Engineer

Evaluates the 16-Bit PACER Kit

by John Snell

(Reprinted from PCC)

Editor's Note: John Snell is an unusually competent electronic engineer who joined the PCC staff some months ago. Prior to that time, he was working in the "real world" (or unreal world; it depends on your viewpoint) as an EE in the San Francisco Peninsula electronics industry. He found such work too time-consuming, keeping him from more important work, namely research into the design and implementation of very esoteric computer-music systems. He also needed more free time to work with some associates on their exotic video/lazer/lightshow systems.

So, PCC agreed to hire him for our usual paltry pittance, so he could do his research and keep our electronic widgets working. The PACER kit is one of those widgets, recently received. Incidentally, John is a graduate of Carnegie-Mellon University, one of the top computer engineering schools in the nation.

I recently put together a Pacer 3H microcomputer development system kit, made by Project Support Engineering. It has by far the easiest to use operational and debug functions of any computer kit that I have used. It has a NOVUS type (no tactile feedback) calculator keyboard built into the front panel. When you want to deposit a number such as 7532, you hit the 7, 5, 3, 2 keys on the keyboard instead of binary switches 1,1,1,1. If you know hexadecimal, the keyboard will convert from decimal to hexadecimal as well as perform hexadecimal arithmetic. Addresses are displayed to the left and data contents to the right in alphanumeric LED's. Using the keyboard you can examine and/or modify not only memory locations but also:

- 4 accumulators X 16 bits,
- a 16 bit program counter,
- a 16 bit status register,
- a 10 word X 16 bit stack,
- a 16 bit value register for scanned memory to find the address at which a value is located,
- a 16 bit mask (for use if you are not certain about some of the bits or digits in the value),
- and 10 break point registers, 16 bits each.

The keyboard will also allow you to sequentially increment or decrement through memory or internal accumulators and registers for examination or modification of contents. Other front panel buttons include run, initialize (reset), restart (halt CPU but do not reset), and cancel last command.

The kit includes all parts one needs to have a working desk top microcomputer development system. The CPU board includes the PACE-16 bit MPU with necessary input and output buffers. On the control and I/O boards are two DM8531 (2038 x 8 each) ROMs for the system monitor. Also included on these boards are four MM2112 (256 x 4) static RAMs, one MM7540 keyboard encoder, two hex latches and LED driver circuits as well as all required support components to interface with the two 4 digit displays and 32 keypad. The control board has space for four more MM2112 RAMs. The memory board comes with four MM2112 RAMs. Space is provided for 12 more MM2112 RAMS and four MM5204 (512 x 8) PROMs for future memory expansion. The PAC II card has 2K x 16 of MOS RAM. The PAC I, PAC II, and PAC III cards are optional cards. PAC II is a prototyping card with voltage regulators. All other boards also have their own on board voltage regulators. PAC I is a TTY (or RS232C) interface and resident assembler card. With PAC I the user may perform all the front panel functions from the teletype (or similar device using current loop or RS232C) as well as the following useful functions:

- Load or punch a paper tape — no bootstrap need be loaded.
- Display a block of memory in one of several formats including assembly language (yes a dis-assembler! very useful), ASCII, hexadecimal, unsigned decimal, or signed decimal.
- Set, list, or reset break or snap points (Break points are placed at strategic locations in a program. They halt execution and display the contents of specified registers and memory locations. Snap points do the same except program execution is not halted.)
- Enter programs in assembly language format (the assembler converts your programs line by line as you type them, to hexadecimal. No paper tape or cassette need be used for this. The assembler and other features listed here reside in two EA4900 type ROMs which hold 16K bits each.)
- Use symbols; the assembler does all address assignment and referencing. (One may also list the symbol table, delete a symbol or clear the table.)

In addition to the resident ROM memory in PAC I space is provided for twelve MM5204 (512 x 8) PROMs, for future user resident programs.

So what else comes standard with the basic Pacer kit? A case, keyboard, push buttons, alphanumeric LED's, all interface logic for keyboard and LED's, a power supply, a mother board (which reduces interconnect wiring and makes expansion easy), cables, connectors and a fan. Space is provided on the motherboard for 8 extra PC boards for future expansion. The power supply included in the kit will put out 8 amps total. If you used mostly CMOS on optional PC boards, the power supply would probably allow you to fill all the available space on the motherboard. P.S. I says the supply will power the CPU board, control board, front panel and logic cards, standard memory board, plus a TTY line assembler (PAC I) and two RAM (2K x 16) memory boards (PAC II).

The assembly of the Pacer 3H was easy and quick. I had only a couple of minor problems. I forgot to connect the fan power lines at the right step of assembly. So I had to remove some heat shrink, solder wires, and then put new heat shrink on. Really no big deal, but I don't have a heat gun or hair dryer. Shrinking heat shrink with a match near the plastic case was somewhat of a hassle. I really should get a heat gun. They are also great for troubleshooting circuits with temperature sensitive problems.

There is a thin flexible cable that runs from the keyboard to the logic. This looked fragile, so I took my time installing it in its connector. Once installed however it will never be moved or flexed again, so this is really nothing to complain about.

The Pacer worked perfectly the first time I turned on the power. As I played with it, I began to appreciate the beauty of its high level front panel operational and debug capabilities.

Now I wanted to try our teletype with it. I quickly wired up our TTY to the connector and plugged in a PAC I pc board (TTY interface/resident assembler). The TTY would not work — oops, I neglected to ground the TTY select (low = select) pin on the connector. Once I did this everything worked perfectly, and I enjoyed exploring the fine operational capabilities of the unit.

Available soon from P.S.E. will be a PROM burning board, and an audio cassette interface, a CRT character generator and interface, a floppy disk interface, and BASIC (the debugged program burned into PROMs as well as other programs in firmware. Since the Paces shares instructions with the IMP-16 (minor modification of programs might be needed), there is a lot of software already available. The Bit Bucket 2 newsletter is the best source of PACE and IMP-16 software.

Program listings are free, source tapes $5, object tapes $3.

Overall I very much like the Pacer. I wish sockets had been provided for all
PACER continued

the IC's and a heftier power supply had been used, however, these additions would of course increase the cost. The front panel operation and debug capabilities are the best I have seen on any commercial computer kit. I have not used any PAC II operational memory cards yet; so I can't evaluate them. However, I would highly recommend the PAC I TTY interface/resident assembler optional card. Having an assembler and dis-assembler as well as a system monitor in firmware result in relatively quick and easy assembly language, programming and debugging. The 16 bit instructions and data provide for efficient assembly language programming as well as increased accuracy. One may use words as a whole or in 8 bit bytes. Common memory and peripheral addressing result in simple quick instructions.

With the Pacer's 16 bit accuracy and easy I/O and a couple of floppy disks, one could program something like Music V3 and Score4 for composition and playing of high fidelity music. Of course you would also need a 16 bit DAC5. If a very fast hardware multiply card were added as well as a fast TTY interface/resident assembler card, designed for general purpose use totally unassembled (not recommended by 2K x 16 DAC), a very fast hardware multiply card were added as well as a fast TTY interface/resident assembler card. Having an assembler and dis-assembler as well as a system monitor in firmware result in relatively quick and easy assembly language programming as well as increased accuracy. One may use words as a whole or in 8 bit bytes. Common memory and peripheral addressing result in simple quick I/O instructions.

Fourier synthesis to be coming out from National Semiconductor. The possibilities are the best I have seen on any commercial computer kit. I have not seen any.

Club group buys would help reduce costs.

Pacer 1H -- totally unassembled (not recommended by P.S.E. for beginners.
Pacer 2H -- completely assembled, tested and burned in.
Pacer 3H -- unassembled except for logic cards which are tested and burned in.
PAC I -- TTY interface/resident assembler card.
PAC II -- 2K x 16 MOS RAM card.
PAC III -- prototyping card with voltage regulators.
PAC IV -- dual 43 pin mother board connector (this comes with PAC I, PAC II or PAC III).

Fan kit -- designed for general purpose use

PHILA STORE OPENING

The Computer Room is opening in Philadelphia, located at Juniper and Sansom Streets. Though we are unclear of the exact relationship, it is evidently closely associated with Carol Groves of Castle Systems Co., 1028 Spruce St., Philadelphia, PA 19107, 928-1268.

DOC QUESTION ON 64-CHAR MOD FOR TVT-II
(Copy of a letter to Digital Designs)
To: Digital Designs
P. O. Box 4241
August 18, 1976
Victoria, Texas 77901

David O. Valliere, [see DDJ, Vol. 1, No. 6, page 29]

I received the circuit board to convert my SWTPC TVT-II to 16 x 64 characters from you last week. I have not installed it yet. In the meantime I have modified my TVT-II diagram to include the changes. At the same time I decided to check your modification to see if I could convince myself it would work.

I failed. But I think I know what's wrong. Three things bothered me.

1. There seems to be no source for the logic net comprising pin 9, IC28, pin 13, IC33 on the TVT board.
2. There seems to be no source for pin 15, IC42 comparator.
3. Connection I on your circuit board had no instruction referring to it.

I would like to know if the following correction is correct. Remove the following instruction from page 4 of the instructions: Connect pin 15, IC35 to H. Add in its place the following two instructions: Connect pin 13, IC33 to H; Connect pin 15, IC42 to I.

Walter Cole
5868 Pentz Way
San Jose, CA 95123

P.S. I am very interested in your upper/lower case and computer controlled cursor modifications for the SWTPC TVT-II.

ENDLESS LOOPS SUGGESTED TO AVOID TAPE-STRETCH PROBLEMS

Dear Dr. Dobb's,

Since we have been experiencing tape-stretch problems and other Natal problems when we have to run BASIC back and forth on the cassette machine to load our APPLE every morning, I was going to ask you for your best medical advice, but have solved the problem with a home remedy. Being new to this cassette business, I figured they should only run in one direction, but no, wham-bang, you have to rewind the buggers—this stretches and pulls and raises general hell with the tape! So why not just run in one direction? No reason why not if you use an endless loop tape! TDK puts out a high quality loop tape in 20 sec., 30 sec., 1 min., 3 min., 6 min., and 12 min. versions (something for everyone)—so you can save your favorite games or BASIC on a tape that will run round-and-round and just wait for the beginning to press load.

Sorry I didn't get the prices (they are expensive), but just finding the things after calling a dozen places threw me off. They are available from:

Qument Electronics
1000 S. Bascom Ave.
San Jose, CA
(408) 998-5900

If you have a loading indicator, file no. select, or can listen to the tape, endless-loop makes a fast single loading device.

What can you do about my wisdom teeth?

Dr. Dobb's Journal of Computer Calisthenics & Orthodontia, Box 310, Menlo Park, CA 94025
The Computer at Puberty
(reprinted with permission from Technology Review, May 1976; Copyright 1976 by the Alumni Association, M.I.T.)

The computer already seems to be everywhere, doing everything, but according to a group of prominent computer scientists, the industry has only just begun an explosive growth. Over the next two decades it will enter home, business and factory as never before.

This was the principal conclusion of preliminary reports on an extensive study of "The Future Impact of Computers" being performed by computer and social scientists at IBM, Stanford, M.I.T., Harvard, Yale, Princeton, and other prominent institutions.

The study, coordinated by Michael Dertouzos, Director of M.I.T.'s Laboratory for Computer Science, and Joel Moses, Associate Director, is sponsored by AT&T, IBM, the Office of Naval Research, and M.I.T. To be completed in 1977, it consists of an integrated series of carefully thought-out and hashed-over papers on key topics in the computer field. The participants in the study, key people in their fields, occupy excellent positions to ponder the computer's future, said Professor Dertouzos. But, perhaps just as important, their influence could make their predictions self-fulfilling prophecies.

At the symposium marking the 100th anniversary of the telephone, many of the participants in the study gathered to offer a fascinating glimpse into a future stuffed with computers.

The hardware of the computer should be about the least restraining influence on the computer's future, according to scientist-entrepreneur Robert N. Noyce, Chairman of Intel Corp. His analysis shows that the size of computer components could be reduced a hundred to a thousand times, from even the tiny circuits of today, before they begin bumping "down" against the fundamental thermal noise limits on size. And technological advance has allowed the complexity of integrated circuits to double every year since 1960, he pointed out, a trend that should continue, allowing ever lower costs for ever more powerful computers. The future almost certainly holds reductions in size and cost, and increased in complexity as remarkable as those that brought pocket calculators from the engineer's workbench to citizen's pockets.

The Computer at Home

The key to these technical advances is continuing profitability, said Dr. Noyce. His company is a leader in the high-technology semiconductor industry. For the computer to remain a profitable product, said Dr. Noyce, it must become a mass-market item. And according to Professor Moses, the computer will mount a massive invasion of the home over the next two decades.

The first wave, said Professor Moses, will consist of computers which perform tasks not requiring connection to a communication network - such networks will probably bring up the rear in computer developments.

Professor Moses foresees computer games and other recreations, "smart" household appliances, home education programs, and efficient household heating and cooling control as the first uses for home computers. Indeed, many such products have already appeared in the marketplace: computer-controlled machines now being marketed include microwave ovens, television sets, automobiles, and, of course, the popular electronic games, which can be played through one's TV.

Eventually, however, computer communications networks for the home will evolve, and subscribers will have enormous volumes of information at their fingertips - via home computer consoles that will cost about as much as today's color TV sets. Computerized encyclopedias, electronic mail, and enormous electronic "newspapers" which would allow the reader to delve into whatever subject he wished. Also possible would be a new form of electronic "junk" mail - when a subscriber wished to buy something, he could use his computer to summon all the current advertising for the product, and comparison shop from his easy chair. This divorce of news from advertising could also affect the content of news, noted Professor Moses. No longer would a reporter on auto safety worry about irate car dealers cancelling ads, should he criticize their product.

There will also be other changes in the kinds of information we receive, with the advent of the "information utility," according to John McCarthy of Stanford. Computerized publishing would increase competition, because the expensive printing process would be eliminated. As soon as a manuscript was ready, it could be instantly available. The nature of public controversy in the computer age would also change, said Dr. McCarthy. When one candidate attacked another over the computer news network of the future, the average citizen could immediately dial up the opposing statements. Thus, public stands would be much more carefully considered before being made public. Also, government information would be truly public for the first time. Instead of being stored away in dusty archives, available only to those with the wherewithal to dig it out, the data would be instantly available on the average person's home console.

Giving Computers the Business

Although business and industry are already heavy users of computer power, they will become even more so in the future, according to the study participants. One major trend will be toward the "paperless office," said Victor A. Vyssotsky of Bell Telephone Laboratories. Records and communications will be stored and transmitted by computers rather than as pieces of paper. However, said Dr. Vyssotsky, the clerical worker will by no means be out of a job; rather the nature of his job will change drastically, from paper shuffler to electron pusher. Computer methods for assisting managers would also make gradual process as business tools.

"Overall, I anticipate a modest steady improvement as a result of further computerization of business functions," said Dr. Vyssotsky. "At a very rough guess, this improvement, over the next twenty years, may be something like two per cent per year for a force which may run somewhere around forty per cent of the U.S. work force."

Manufacturing will also see much greater use of computers than even today, according to Professor Dertouzos, who wrote the portion of the study on that subject. The key technical developments in this area will be programmable robots with senses of touch and sight; microcomputer-operated control systems integrated into aircraft, autos, home and factories; and networks of robots or control systems capable of working together.

Out of these technologies, Professor Dertouzos sees emerging automated factories that could produce products tailored specifically to each customer. For instance, a customer might order shoes fitted to his foot measure-
ments, and the shoes would be manufactured on the spot. Such automation would revive U.S. industries currently being strangled by cheap foreign labor. Also, said Dr. Dertouzos, robots would continue to take over dangerous jobs, preserving human life; and they would relieve humans of mindless tasks, enabling them to do truly humane tasks.

"While the popular view of an automated future involves a heartless and mechanistic society geared to productivity and efficiency, I advocate the opposite view that computers will improve and humanize our way of life," he said.

The major plea throughout all the scientists' discourses was— as Terry Winograd of Stanford University put it—that computers be "peoplozed." The computer must be taught to adopt the syntyle of communication natural to people, and not the foreign language it is now allowed to use. Computers that understand human dialogue, that can take human speech as an input, and that can explain their actions and reasoning to humans will represent major steps in this direction.

Perhaps them the computer will become as benign and helpful an invention as is the telephone, whose 100th anniversary the conferees were observing. — D.M.

A THEATER COMPUTER USERS GROUP

Support of a Theater Computer Users Group is being considered by Theater Sources, Inc., a non-profit, tax-exempt corporation. Persons who have developed programs for applications in the area of live drama are invited to contact TSI with suggestions, information, and requests to be placed on a preliminary mailing list. Write TSI-TCUG, 4712 Northway Dr., Dallas, TX 75206.

The form of support has not been set, but may include a newsletter, reproduction of listings or decks on file and/or meetings for exchange of information. Suggestions are welcomed. Costs of services will be covered by modest fees.

Uses of the computer in theater might include rather ordinary uses such as bookkeeping, accounting, and mailing lists, but can also be extended to ticket sales, seating charts, budgeting and artist records. Further extensions might include creation of buying and cutting lists for sets and costumes, visualization and modification of designs, and other interactions between artists and machine to ease the tedium of craft.

Theater Sources, Inc., is a non-profit corporation under Texas law, created to "gather and distribute information about live theater" and granted a federal tax exemption. Its current activities include publication of PROLOG, a newsletter for playwrights, and THEATER ACROSS AMERICA, for community theater, and the National Theater File, timeshare access to theater information.

Contact: Mike Firth, 4712 Northway Dr., Dallas, TX 75206, (214) 363-5003.

SOUTH CAROLINA HOBBYIST GROUP FORMING

South Carolinians interested in forming a persona computing club should contact Dewey K. Barefield, Box 452, Hodges, SC 29453.

ROBOT FEATURED AT ACGNJ MEETING

BUSTER-II, a robot, will be the featured demonstrator at the October meeting [of the Amateur Computer Group of New Jersey]. BUSTER-II is a home-built robot controlled by an MOS Technology KIM-I microprocessor.

BUSTER-II was designed and built by Rod Loofburrow. Rod, who is 14 years old, is another of John Loofburrow's young sons . . . you may remember Wayne Loofburrow (age 13) who demonstrated a 6800 Assembler at the March meeting.

Rod will be explaining the technical side (or is it inside) of BUSTER-II, demonstrating the robot's abilities, and answering all questions (sorry, as yet, BUSTER-II does not have a voice).

The October meeting will be held at, and sponsored by, Middlesex County College, Edison NJ, on Friday, October 15th. The meeting will be held in Building No. 4, The College Center, Cafeterias B and C (same as last meeting at MCC).

There will be a Flea Market, starting at 6:30 p.m. Tables are available ($2 contribution is asked). Remember to bring your own extension cords.

BUSTER-II will be doing his thing at 8 p.m. We must vacate the building by 10:30 p.m.

Editor's Note: We are publishing this, not as a meeting announcement for the ACGNJ, but rather, because of the unusual and fascinating nature of the presentation being given at their meeting.

LOOT FOR USELESS HEADS

If you happen to have any crashed or worn-out disc heads, you might be able to peddle 'em for nominal cash. Trans-Data Corp [170 Glenn Way, Belmont, CA 94002, (415) 593-8545 (Don Collier)] is looking for heads for IBM 3390's and 2314's.

[ANOTHER] MICROCOMPUTER PRODUCT SURVEY

Dear Sir, Sept. 9, 1976

This letter is to announce to you the publishing of The Microcomputer Product Survey. As we at Small Business Systems are sure you realize, there are a number of individuals who have claimed to offer a microcomputer product survey which has turned out to be little more than a chip feature list. The M.P.S. is a two volume report on the hard and software being offered in the small and personal computer market.

The first volume will be released in November and will deal with Microcomputer Hardware, Peripherals and the companies that manufacture them. The second volume will deal with Software and the additional companies which supply only software and is scheduled to be released in January, 1977.

The organization of Volume 1 will be a series of 16 charts covering all the major mainframes and peripherals. The peripheral section will include plug compatible memory and I/O cards. All of the hardware will be cross-referenced to the company profile. The peripherals will also be cross-referenced by mainframe compatibility. The general form for Volume 2 will be three charts and a series of plain text discussions of applications program services. The charts will compare general types of instruction for the three general classes of software, operating systems, assemblers and higher level language.

The two volumes will be supplemented with periodic product supplements to allow the M.P.S. to be one of the most timely sources of performance parameters in the marketplace today. SBS has planned to allow the individual three options to personally determine the worth of the M.P.S. A subscription to the M.P.S. is only $9.00 a year, a sample issue is $3.00 and complete details for only $1.00.

Yours truly,

Timothy D. Sisson
General Manager

How to Code Code
Jack Armstrong's Super Decoder Ring

by Jon O. Stedman, 1450 Alice St., Oakland, CA 94612

Nostalgia time, gang! Remember when Jack Armstrong was sending his secret messages over the radio into your home? For only two box tops of some breakfast cereal, you could order your own SUPER decoder ring. In no time, you can be passing secret messages like any international spy.

In reality, we have a super cryptographic machine in the homebrew micro-computer! Complicated cyphering techniques can be programmed to baffle all of those government snoops who like to read other people's mail.

Simple letter substitution ciphers are easily broken with a little statistical analysis on the letter frequency of the code-text. Many other cyphering techniques are public knowledge (see your public library) so the secret part of a coded message is the code word which is the "key" to decoding the message.

For instance, John Kennedy used the key ...HEAVY EQUIPMENT and the Playfair cipher to send a rescue message from his wrecked PT 109. Had the Japanese intercepted and de-cyphered that rescue message, then history would have been changed!

Personally, computer games don't interest me much, so I hope that the following specifications will excite someone to write a Playfair program and that cryptography will become a developing interest to hobbyist computer users.

You can try your hand at Playfair with the following bit of encyphered philosophy.

KPGHU WKPGA EWAQG EHBZ PBVRN EYUFZ ATSHY BMZQE VYVSN EVGUE WZREU BMZQE VYUGG YEBZL
Use Kennedy's code word HEAVY EQUIPMENT.

PLAYFAIRE—DIGRAPHIC CRYPTOGRAPHIC CYPHER

This code technique uses a 5 x 5 array matrix. The elements in this array can be considered to be ordered into rows and columns. Each row in turn also is ordered in a cyclic fashion.

The first cell of row number 5 is the one in the lower left-hand corner of the array. The second cell of row number 5 is directly to the right of the first cell. This ordering continues until the 5th cell is reached (the one in the lower right-hand corner), then the cycles begins again. Thus the elements in row number 5 are ordered in a cyclic way as follows:

1→2→3→4→5

In a similar way, the elements of each column can be considered to be ordered in a cyclic pattern as follows:

1
2
3
4
5

Since the array has room for only 25 letters, the letters I and J will be considered to be interchangeable. I and J will occupy the same array element. In a similar way, X and space will occupy the same array element, but only X will be used as a code letter.

The key to filling in the 5 x 5 array with the letters of the alphabet turns on the use of a "code word."

In the absence of a code word, then the normal alphabetic order is followed in filling the array. The array is filled row by row, i.e., row number 1 through row number 5.

The use of a code word permutes the order shown above.

With a code word, fill up the array as follows:

Fill the array (row by row) with the letters of the code word in the order they occur in the code word. Remember not to use any letter twice from the code word. After the code word letters are exhausted, then complete the array...
with the remainder of the alphabet (in alphabetic order, of course).

Example: code word is JUNEMOON

The code word has been entered into the array. Note: (J/I) J and I occupy same cell. O is used only once. N is used only once.

The array is then completed with the remainder of the alphabet.

Playfair is a digraphic technique that destroys the letter frequency distribution found in a particular culture-language. The technique is to transform letter pairs into another letter pair, i.e., digraph is a letter pair. For instance;

Plain-text [F,A] ↔ [G,O] Code-text

Of course, digraphs have a known frequency distribution, but the number of letters is small (approximately 26) and the number of digraphs is large (approximately 26 x 26); so a much larger volume of code traffic is needed to build any statistics.

There are 4 cases to consider using the Playfair array.
I. Both letters of a digraph are in the same row.
II. Both letters of a digraph are in the same column.
III. The letters of a digraph are in different rows and columns.
IV. Both letters of the digraph are the same.

Case I: Both letters of a digraph are in the same row.
Method: each letter is replaced by the next letter in order in the given row. Example: Row number 2 from JUNEMOON array above.

Case II: Both letters of a digraph are in the same column.
Method: each letter is replaced by the next letter in order in the given column. Example: Column number 2 from JUNEMOON array.

Case III: Letters of a digraph are in different rows and columns. Method: The vector formed by the line from the first to the second letter of a digraph is one of the diagonals of a rectangle. The two diagonals form the equivalence between the text-digraph and the code-digraph.

For instance, the digraph [F,U] defines the diagonal and rectangle:

The mirror image of the [F,U] diagonal is the [G,J]
Music by computer

Yamaha has interfaced an electronic organ with a computer so that the organ can be played either by the computer or a musician.

A PDP-8 minicomputer is able to control the instrument, reproduce previously recorded musical scores and display them on a cathode ray tube.

Using a core-resident real time operating system, the minicomputer can sense what is being played, interpret this data and compare it with storage.

Yamaha anticipates that the organ may one day be taught completely by this method. Students will be able to compare the written music stored in the computer memory with what they actually play as displayed on the cathode ray tube. Practice sessions can be recorded for critique by instructors at a later time.

Digital's GT40 graphics terminal was chosen for its interrupt handling capabilities, refresh-type display and cost effectiveness.

The refresh display is ideally suited to the dynamic pattern changes in a musical score. Since the GT40 converts the binary data obtained from the memory area (DMA) to analog form and displays it on the CRT independent of the central processing unit, the processor can be dedicated to the organ, making possible the real time applications of the recording and playing back.

(conclusion of Decoder Ring Article)

Matrix notation—(row number, column number):

\[
[(F),(U)] = [(3,1),(1,2)] \leftrightarrow [(3,2),(1,1)] = [G,J]
\]

Therefore—

\[
[(\alpha, \beta) (\delta, \zeta)] \leftrightarrow [(\alpha, \zeta) (\delta, \beta)]
\]

Case IV: Both letters of a digraph are the same. Method: the letter X is to be inserted into the plain-text to separate double letters. Example: BALLOONS would be broken into digraphs as [BA], [LX], [LO], [NS].

In order to break up the appearance of words, the plain-text is run together by leaving out the spaces between the words. Sometimes to improve on readability and avoid ambiguous situations, X's are inserted for the spaces between words.

The code-text output is in a standard fixes format of 5 letters per word.

EUNFE RAHXJ UPZWO etc.

PROCESSOR TECHNOLOGY ANNOUNCES WINNERS OF Personal Computing '76 DRAWING

Processor Technology was one of a number of vendors which donated "door prizes" for the Personal Computing '76 convention in Atlantic City. The P.T. door prizes consisted of two $500 merchandise certificates. The winners were: E. Eibling, Florham Park, NJ; Barbara Ataran, Montclare, PA.

AN 18-BIT PDP-11?

Rumor has it that Gordon Bell originally designed the Digital Equipment Corp. PDP-11 as an 18-bit machine (note the bus width), but DEC Marketing decided to make it a "byte" machine and reduced the BRANCH range.

TIMER ROUTINES FOR 6800’s

Gentlemen: Sept. 3, 1976

I have found in writing programs, that often a time-delay can be used to spice up a program. The following subroutine will generate time delays between 1 and 255 seconds. To use the routine, load register-B with the number of seconds you wish to delay and then jump to the subroutine. The subroutine returns after the specified number of seconds.

To show how it works, I have enclosed a short program that uses the time delay routine to ring the bell on a teletype once every 30 seconds (make it 3 minutes and you’ve got an egg timer).

How it works:

**LOOP1** is the basic time-delay loop. Traversing from line #11 to line #14 takes 20 clock cycles. This loop is executed 50,000 times (C350 Hex). Thus to complete this loop requires 20 x 50,000 or 1 million clock cycles. Since the clock frequency on the 6800 is 1 Mega-hertz, it takes one second to complete.

**LOOP2** is the “outer” loop which by decrementing and testing register-B allows varying delays by repeating **LOOP1** the specified number of times.

Line #9 and #17 save and restore the X-register to the value it had when the routine was entered.

Note: If you put a radio next to the CPU and tune to the interference, there will be an audible click each second (a darkroom timer??). These routines were assembled by a cross- assembler I have written in IBM’s BASIC.

Sincerely,
Gregory A. Worth

**MICRO BASIC PLUS FOR $15.95**

**INCLUDES COMPLETELY ANNOTATED SOURCE CODE**

(NEWS RELEASE FROM TECHNICAL SYSTEMS CONSULTANTS, BOX 2574, W LAFAYETTE, IN 47906)

You have seen the “TINY BASIC” and “MICRO BASIC” for the 6800 which fit in a small system (2-3K) and offer 10-15 statements and commands for the user to write BASIC programs. These systems range from quite slow (due to 2-level interpretation techniques) to surprisingly fast for a small system. The limiting factor in these versions of BASIC is the incomplete selection of statements, commands, and functions. The lack of certain statements means having to do without, resulting in less efficient programs.

TSC has solved this problem by creating MICRO BASIC PLUS. It is not a 2-level interpreter so it runs considerably faster than ones implemented using the 2-level technique. Statements available to the user include PRINT, INPUT, READ, DATA, RESTOR, IF... THEN, GOTO, GOSUB, RETURN, ON...GOTO, ON...GOSUB, FOR, with positive and negative STEP, NEXT, LET, DIM, for both single and double dimensioned arrays (up to 98 by 98), EXT, REM, and END. The commands available to the user are LIST, SCRAMBLE, RUN, and MONITOR. There are also several functions available which include TAB and SPC (for output formatting), RND, ABS, SGN, and + (used for exponentiation). This list of features does not stop here. MICRO BASIC PLUS also contains a complete line editor, multiple statements per line, direct execution of most statements, large arithmetic range than others (+999999), complete error identification including printout of the line number where the error occurred, and a very simple procedure for dumping the users BASIC program to paper tape or cassette and then reloading it at a later time. Also included is an EXTERNAL statement which allows the user to write 6800 machine language subroutines to be called during BASIC program execution.

You are probably thinking this all sounds great, but if the less extensive versions of “TINY” or “MICRO” BASIC require 2-3K of memory, this one must require 5 or 6K since the capability is doubled. Well, here is the “icing on the cake!” MICRO BASIC PLUS resides in just a fraction over 3K which means in a 4K system you still have room for a 30 to 60 statement BASIC program! Not only is the interpreter approximately the same size as others, TSC has made special provisions for keeping the users program source to a minimum (e.g. all commands and statements can be entered using the first 3 letters of its name).

Now you are probably saying it must be expensive. You are right if you think $15.95 is expensive, but we think this will also please you. Unlike others, we include the complete commented source listing, hex dump for fast entry using MIKBUG, sample programs, sample output, plus TSC’s famous instructions and documentation for use. As all TSC 6800 software, this program uses MIKBUG I/O routines but instructions are provided for adapting to other routines. Write for details concerning availability of MICRO BASIC on “Kansas City Standard” cassettes.
Tiny BASIC for the 6800 & 6502 from Tom Pittman’s “Company”

Editor’s Note: Tom Pittman is Itty Bitty Computers. Tom is an avid computer hobbyist who is one of the more major figures in the San Francisco Bay area’s Homebrew Computer Club. He is also an experienced software consultant who specializes in small-computer software and systems. We strongly recommend him to you because (1) we have received a number of communications praising Tom’s Tiny BASIC for the 6800, (2) we have yet to receive a written or verbal complaint about the quality of Tom’s products, (3) we have ample evidence that Tom consistently exhibits an unusually high level of responsiveness and good business ethics in dealing with his customers, and (4) we are delighted to see a competent systems software specialist offering excellent software products to home computer users at very nominal rates, and wish to do everything we can to encourage him and others to pursue this approach to development and distribution of good, low-cost software.

The following information is a duplication of the typewritten data sheet that Tom distributes to those wishing information about his products.

Itty Bitty Computers is dedicated to the principle of high quality, low-cost software for personal computers. Tiny BASIC is our first offering in this field; if it sells well, there will be more. We are not in the hardware business—software is all we sell. The emphasis of all our software is small size and flexibility rather than high speed. Tiny BASIC will run in as little as 3K of memory.

Tiny BASIC is a subset of Dartmouth BASIC, with only 16-bit integer arithmetic. There are only 26 variables (A-Z), no arrays, and no strings. The 12 commands (LET, PRINT, INPUT, IF, THEN, GOTO, GOSUB, RETURN, REM, RUN, LIST, CLEAR, END) are adequate for most programming needs. A machine language subroutine calling facility enables the user to extend Tiny BASIC to any degree necessary.

Single copies of Tiny BASIC cost $5. This buys an individual license to use it, a 26-page user manual, and a hexadecimal paper tape in the manufacturer’s loader format (Motorola “S” or MOS Technology “S”). A hexadecimal listing will be substituted for the tape on request for users without paper tape facilities. Programs are mailed out first class within a few days of receiving the order, but at these prices we can accept prepaid orders only. For airmail service to foreign countries please add $2 per program. A 20% discount may be applied to quantity purchases of ten or more programs of the same version to the same address at the same time.

Tiny BASIC itself does not contain any I/O instructions; three JMPs link Tiny to the user’s I/O routines. These are well documented in the manual. The primary difference between the following versions is the memory requirements (shown in parentheses), though all use memory page 00.

TB680R (0100-08FF) For MIKBUG, EXBUG, and most homebrew 6800 systems with RAM in first 3K of memory.
TB680S (0200-09FF) For Sphere; includes I/O routines.
TB680P (E000-E7FF) For AMI Prototyping Board; includes I/O routines (ACIA), and runs with on-board 1K RAM.
TB650K (0200-0AFF) For KIM and most homebrew 6502 systems with RAM in first 4K of memory.
TB650J (1000-1FFF) For Joit.
TB650W (0300-0BFF) For Apple. Includes I/O routines.

NOTE: The third digit of the version number refers to the revision level. We will ship the most recent version regardless of order specifications (e.g., we are now shipping TB682R for orders specifying TB680R).

MEMORY ALLOCATION STANDARDS FOR HOBBYISTS

by Jim Day

One of the benefits of owning your own computer is the fun of exchanging programs with other hobbyists. So far, this has been fairly easy to do. It is easy to load a BASIC program from an ASCII tape or to bootstrap a machine language tape into a “cold” machine. But this situation may not last very long. As more hobbyists begin to use ROM-resident operating systems and a wider variety of peripherals, compatibility problems may become much more difficult to resolve unless standards are established for memory allocation.

I suggest that the first 16K of memory be reserved for the operating system, including resident processors and I/O handlers. Standard port numbers and handler entry points should be established for all kinds of peripherals, including the exotic ones. Allocation standards need not work a hardship on those with smaller amounts of memory, since memory modules don’t have to be contiguous. That is, a 2K machine could have 1K of memory starting at address 0 and the rest starting at 16K.

Needless to say, the standard handler “entry points” would simply be instructions branching to the real entry points somewhere within the first 16K of memory. Likewise for the entry points of language processors, text editors, etc. Attempts to use unimplemented programs should cause a branch to an error routine.

6800 CAN SHARE HOBBY-STANDARD BUS WITH 8080 WITHOUT CONFLICT

M.R.S. has developed a 6800-based board that plugs into a hobbyist-standard (Altair, IMSAI/SOL/ Cromemco/Polymorphic/etc.) bus. Even while installed in the bus, it will allow any also-resident 8080 to run without interference. It gains control of the system via a single instruction, and returns control to the 8080, either via the halt switch or via software instructions. The 8080 unit handles all front-panel interface.

A fully assembled and tested unit is available for $180 with kits available at even lower cost. The mailing address for M.R.S. is Box 1220, Hawthorne, CA 90250.
SAVE AND LOAD MODS TO PITTMAN'S
6800 TINY BASIC

Dear Jim,

Here are modifications I've written to Tom Pittman's 6800 Tiny BASIC. The additions are confined within the 2K size for the interpreter. The Sphere 6800 user will now have the ability to SAVE and LOAD programs he has written in Pittman's Tiny BASIC. I do not think the modifications submitted infringe on the proprietary rights of Pittman's Tiny BASIC.

Sincerely,

Henry L. Kee
42-24 Colden St.
Flushing, NY 11355

Dr. Dobb's Journal of Computer Calisthenics & Orthodontia, Box 310, Menlo Park, CA 94025
A BASIC TERMINAL EXCHANGE PROGRAM

Written by Robert Wilcox
920 N. Washington
Owosso, MI 48867  Sept. 13, 1976

The purpose of this program is to add the ability to talk to two terminals to those versions of MITS BASIC which do not have the console command.

The terminal change is accomplished by calling a machine language (USR) program which has been loaded into reserved high memory. The program may be loaded by use of the BASIC program given here, or in the case of 4K BASIC which does not have the POKE statement, by use of the front panel switches.

When the USR program is called, it interrogates each I/O handling location in BASIC. If Port Number 20 or 21 is found, it is changed to Port Number 22 or 23, respectively. If the BASIC is already addressing the higher port, it is changed to the lower one. Thus, if one terminal is addressed to Port 20-21, and another one to Port 22-23, control will be passed back and forth between them whenever the USR program is called.

The USR program may be called by a direct command, such as:

X = USR(1)

or, this may be an indirect (numbered) statement in a BASIC program:

110 X = USR(1)

The following statement:

10 X = USR(1):GOTO 10

will cause control to alternate between the two terminals. Typing a Control-C on either terminal will cause command to stop at that terminal.

The program is written for 8K BASIC, Version 3.2, supplied on paper tape. "*" indicates data to be substituted for the cassette version, and "**" indicates data for 4K BASIC.

BASIC PROGRAM WHICH LOADS THE USR PROGRAM:

5 REM REMEMBER TO RESERVE MEMORY SPACE WHEN INITIALIZING BASIC
10 POKE 73,208:POKE 74,31
20 L=6144
30 READ D$:IF D$="END" THEN END
40 GOSUB 120
50 POKE L,D:L=L-1:GOTO 30
60 DATA 021,355,037,032,376,377,310,157,023,032,147,176,376,022
70 DATA 372,350,037,326,002,167,023,303,323,037,306,002,303,343
80 DATA 037
90 REM USE LINE 100 FOR PAPER TAPE VERSION.
95 REM USE LINE 110 FOR CASSETTE VERSION.
100 DATA 301,004,311,004,314,004,323,004,176,005,332,005,377,END *
110 DATA 321,004,331,004,334,004,343,004,216,005,352,005,377,END *
120 D1= VAL(MID$(D$,1,1))
130 D2= VAL(MID$(D$,2,1))
140 D3= VAL(MID$(D$,3,1))
150 D=D1#64+D2#8+D3
160 RETURN

This is an assembly listing of the USR program. Note that the data is different for the different versions of BASIC. Before this program can be called by the USR command in BASIC, its starting address must be loaded in BASIC in locations called "USRLOC". This is taken care of in line 10 of the BASIC loading program. For 4K BASIC, you must load this information in by the front panel switches: load 320 at location 103, and 037 at location 104.

RASKIN REPENTS

Dear Dr. Dobb,

In my article in the last issue "A Bit of Wheat Amongst the Chaff" I said that Processor Technology should have advertised their "3P+S" clearly as a 2 parallel channel device, with serial port and a control port. They should have. But I found a P.T. ad, I am happy to say, done a while ago, that mentions in the fine print the exact truth.

They should have, perhaps, called it the 2-1/3 P+S?

Jef Raskin

ERRATA FOR WRIGHT'S ALPHA-NUMERIC MUSIC

Dear P.C.C./Malcolm T. Wright:

Please be informed that your publication, Alpha­numeric Music with Amplitude Control, contains a typographical error in the program listing:

Page 13, Address 001,103 should be 001.

This JUMP references STORE in Page 0, but the object listing references Page 0. Source is correct; object is wrong.

A. Paeth

P.S.—Sounds fine. Forced me to write a hex-octal keyboard read routine.

[Why not submit the keyboard read routine for publication in DDJ? –JCW]

UNCLE SAM CONSIDERS ESTABLISHING A "SCIENCE COURT"

The National Science Foundation and the Department of Commerce are jointly studying a proposal to create a Science Court. Such a court would be especially organized to handle disputes involving highly technical matters, disputes that are currently adjudicated by courts having judges of no particular technical capability.

INTEL HAS RESIDENT PL/M

PL/M, the first and most widely used high-level language for microprocessors, was originally only compilable on large machines. A compiler for it is now available, however, that is resident on their 8080-based Intellec floppy disc system. It requires 65K bytes.

COMPUTER STORE WORKING ON BUSINESS SOFTWARE

A new computer store, Rainbow Enterprises, is reported to be developing programs for very small business systems. They are located at 10723 White Oak Ave., Granada Hills, CA 91344, (213) 360-2171.

PDP-11 CROSS ASSEMBLER FOR 6502's

For $900, you can get a PDP-11 based cross assembler for MOS Technology 6502 microprocessors. The cross assembler is written in MACRO-11 and runs under DEC's RT-11 operating system, using 5K words, minimum. The price includes one year of product support, as well as source code, distributed on a disc. Contact Mike Corder, Computer Applications Corp., 413 Kellog, Ames, IA 50010, (515) 232-8181.

Newsweek

NEWSWEEK NOTES HOME COMPUTING

The August 23rd issue of Newsweek carried almost a full-page article titled, "Computers: Home Cooking." It was the usual story of a couple of example installations—human interest stuff—with the usual inaccurate underestimates of number of stores and clubs, and the usual interview with Paul Terrell of Byte, Inc.
OCTAL DEBUGGING PROGRAM (ODT-80)
FOR THE MCS-80 COMPUTER

by E. R. Fisher

NOTICE: "This report was prepared as an account of work sponsored by the United States Government. Neither the United States nor the United States Energy Research & Development Administration, nor any of their employees, nor any of their contractors, subcontractors, or their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness or usefulness of any information, apparatus, product or process disclosed, or represents that its use would not infringe privately-owned rights."

Abstract

ODT-80 is an octal debugging routine for use on the Intel 8080 microprocessor. This routine provides the capability to examine and modify all of the memory that is available to the microcomputer and transfer program control to the created program. ODT-80 makes use of simple keyboard commands from any terminal—such as a teletypewriter—that is attached to the system.

Introduction

ODT-80 (Octal Debugging Technique) is a program written for the MCS-80 that allows the user to modify a program via a teletypewriter keyboard. The program occupies 400 octal words and must be located in the lowest memory page of the MCS-80 system, since the program uses the RESTART instructions.

ODT has been proved to be an effective aid to debugging on microprocessors. The first version, for the Intel 8008,* has been "front panel" for virtually hundreds of microprocessor applications. The author submits this ODT for the 8080 in hopes that the tradition of soft front panels may be perpetuated.

System Requirements

All addresses of memory locations and contents of memory locations are referred to in octal numbers. A question mark (?) will be typed for any illegal input.

The minimum system requirements for using ODT are as follows:
- MCS-80 computer set
- ODT programmable read only memory (PROM) at memory page 0008
- 256 word (RAM) at page 0108
- Teletype interface with the following codes:

OUT 2—SEND ASCII character

Example

The following example illustrates a typical debugging operation. It is assumed that a program has been assembled and that the program is to be loaded by a loader in PROM 2.

A program listing and a detailed description of the command set follow the debugging description.

1. Set the memory field with the $ command, and read the tape with the R command.

   10S* ; SET MEMORY FIELD TO 10
   OR ; START READER ON TTY
   ? ; WHEN TAPE IS READ IN ODT
   RESTARTS (startup of ODT depends upon the reader program in PROM 2)

2. Start the program with the G command.

   10S ; START PROGRAM AT LOCATION 0

   0G
   TEST PROGRAM

   ; TYPED BY PROGRAM WITH AN ERROR

Dear Bob,

July 16, 1976

For some time now I’ve felt that the hardware oriented types (like me) who only want to spend $100 or so to get started have been completely neglected. I’ve also been approached by many hobby groups who want to know more about the COSMAC microprocessor. To satisfy both types of potential users, I’ve prepared a series of articles showing how to build a complete COSMAC microcomputer (called ELF) for under $100. This series of articles started in the August, 1976 issue of Popular Electronics, and should be of interest to many of your readers who are still looking for a lower cost way of getting started. The basic microcomputer doesn’t need a terminal since input switches and an output display are provided. A novice user can actually do more with this system initially than he could with a $466 Altair 680 by itself (I have both systems). Of course, the COSMAC ELF has no cabinet or PC board and you must handwire 12 chips together. Other articles in the series will provide programs, applications, inexpensive interfaces, memory expansion, and a simple operating system. A very low cost graphic video display is also planned for the ELF microcomputer. I just want to make your less affluent readers aware that plans for a low-cost, do-it-yourself, micro-computer are now available via this series of articles.

Best wishes,

Joe Weisbecker

1220 Wayne Ave.
Erlton, Cherry Hill, NJ 08002

EDITOR’S NOTE: Joe is the architect/designer of RCA’s COSMAC.
3. Change location (30) to correct output. Restart

**Commands**

**(ng) - SLASH**

Open the ng address and type contents in octal.

**(LF) - LINE FEED**

Close the currently open address, and open the next sequential address. The contents of the open register may be changed by typing the octal number to be input and then typing a (CR).

**(.) - PERIOD**

This operator may be used before the (/) operator to open the address last used.

**(ngS) -**

The SET command is used to set the H register to the memory page to be accessed.

**(ngR) -**

The READ operator is used to start a loader program in memory page No. 2, location 0. If this command is preceded by an “nS” command, the n value will be passed to the loader program in the H register.

**(ngG) -**

The GO routine is used to start a program in memory. The octal number typed before the “G” operator will set the starting address in memory. The “G” operator should be preceded by an “nS” command to select the desired page.

**(CTRL-C) - CONTROL-C**

Type out the top two locations in stack. (See trap.) Leaves the stack pointer at its initial position.

**(CR) - CARRIAGE RETURN**

Close the currently open address.

**Utility Routines**

The following subroutines are available to the user as utility routines for other programs:

<table>
<thead>
<tr>
<th>Address</th>
<th>Call</th>
</tr>
</thead>
<tbody>
<tr>
<td>307</td>
<td>RST ODT</td>

</tr>
<tr>
<td>370</td>
<td>0</td>
</tr>
<tr>
<td>315</td>
<td>CAL OCTALP</td>
</tr>
<tr>
<td>301</td>
<td>0</td>
</tr>
</tbody>
</table>

Commands

**(ng) - SLASH**

Open the ng address and type contents in octal.

**(LF) - LINE FEED**

Close the currently open address, and open the next sequential address. The contents of the open register may be changed by typing the octal number to be input and then typing a (CR).

**(.) - PERIOD**

This operator may be used before the (/) operator to open the address last used.

**(ngS) -**

The SET command is used to set the H register to the memory page to be accessed.

**(ngR) -**

The READ operator is used to start a loader program in memory page No. 2, location 0. If this command is preceded by an “nS” command, the n value will be passed to the loader program in the H register.

**(ngG) -**

The GO routine is used to start a program in memory. The octal number typed before the “G” operator will set the starting address in memory. The “G” operator should be preceded by an “nS” command to select the desired page.

**(CTRL-C) - CONTROL-C**

Type out the top two locations in stack. (See trap.) Leaves the stack pointer at its initial position.

**(CR) - CARRIAGE RETURN**

Close the currently open address.

**Utility Routines**

The following subroutines are available to the user as utility routines for other programs:

<table>
<thead>
<tr>
<th>Address</th>
<th>Call</th>
</tr>
</thead>
<tbody>
<tr>
<td>307</td>
<td>RST ODT</td>
</tr>
<tr>
<td>367</td>
<td>RST SEND</td>

</tr>
<tr>
<td>315</td>
<td>CAL OCTALP</td>
</tr>
<tr>
<td>301</td>
<td>0</td>
</tr>
</tbody>
</table>

The A, B, and E registers are used in this routine.

**Trap**

The trap feature of ODT works as follows: When the central processor encounters a 377g as an instruction, the processor decodes this as a restart to location 70g in memory 0g. An example of this is when a nonexistent memory is addressed, or when a 377g is placed in a program for a break point. At this time, ODT stores the pushdown stack the address of the errant location and all of the registers. The trap indication is a “T” typed out on the teletypewriter. Control is now back in ODT and multiple Control-C’s (CTRL-C) typed by the operator will yield, in sets of two, the trapped information in the following format:
The "F" register is the status flags of the 8080, with the format shown in Fig. 1.

Fig. 1. "F" register format.

A CTRL-C typed at any time will type out the push-down stack but not in the format shown above! The above format is only available immediately after a "T" has been sent by ODT.

If a continuous string of "T" are sent to the TTY without stopping, this is an indication that the stack pointer is pointing at nonexistent memory. It will be necessary to restart ODT.

**RESTART/INTERRUPT Locations**

There are five segments of memory reserved in ODT for INTERRUPT or RESTART operation. These locations, shown in Fig. 2, contain jumps to the scratch RAM memory number 10, used by ODT. This allows interrupt service to be handled even though memory number 0 is preprogrammed to contain ODT.

**Notes on the 8080**

The stack pointer is reset to location 3508 every time ODT is restarted via location 0 of ROM 0—in other words, whenever a "?" is sent by ODT. ODT and other programs use the stack pointer; therefore, memory locations plus and minus this location are apt to be overwritten. However, the stack pointer moves down in memory (high addresses to low addresses), so normal operation will keep the stack pointer in RAM 108.

**Acknowledgements**

I wish to acknowledge the work of Jim English, who coauthored with me the ODT for the 8080, from which a large part of this program was derived, and Walt Binge and Mike Maples, who helped on the preparation of this paper.

OOPS!: A Line-Drawing Game for Your Video Terminal

-Martin R. Winzenread

Go Only Where You Haven't Gone Before

You control a cursor with your right four sense switches in any combination. Try to draw a picture on the screen with a line that never goes through the same point twice.

E.g.  can be drawn, but  cannot.

An '!' indicates that you have been there before. You may then restart the program by putting the right four sense switches down.

To change the speed of the cursor, change memory locations 0026 and 002C.

*Change these statements if your VDM is not addressed as port 8C and memory 8800-8BFF
SCRUNCH (Pass 1):
A Compactor for BASIC in 8080

—Martin R. Winzenread

Scrunch readable source code into a form that only a computer could love. Run bigger programs with less memory. Input original source code by paper tape, then dump your scrunched code to paper tape or cassette for later use.

I am presently working on PASS 2 which eliminates unnecessary line numbers by using the multiple statement per line feature.
Dear DDJ,  
Sept. 2, 1976  
For the past eight months, I've worked on designing my own programming language. I've now conceived several clean and fairly powerful procedural languages. The simplest is described in the attached article. I also expect general clean languages, I've become dissatisfied with my previous
eral clean systems. Software that is I want him to see conceptually, and syntactically clean and more useful than
multilevel approach and the specialization that characterizes much existing system software. Software that is "OS dependent" is even less portable than machine code on many systems. I don't want the user to have to learn assembler, editor, JCL, file handling packages, etc. I want him to see conceptually, and syntactically integrated systems.

During the latter part of my spinning of imaginary languages, I've become dissatisfied with my previous definition of HI, as a procedural language which is both cleaner and more useful than PL/I, and incorporating associative retrieval, pattern matching, and list processing facilities. Several ideas have changed my direction:
1. A tiny language (or any language) should be extensible.
2. Most existing extensible languages (LISP, TRAC, FORTH) are limited by primitive syntax.
3. The concept of "set" or "relation" is powerful enough to include all the diverse data structures found in computer applications, and to manipulate them with common tools.
4. A further equivalence can be established between relations and functions; one is defined extensionally; the other is defined operationally.
5. The relational calculus is a powerful form for manipulating such structures. In the past, it has been restricted to data base operations (Codd's DSL ALPHA).
6. Declarations make it feasible for the user to see only a single data structure, ignoring the different internal representations of structures.

I'm attempting to design an extensible relational language with a context-sensitive grammar. Work is presently stalled by a 50-hour work week, 17 semester-hours of school, my home computer, and a promised article.

FORTH is a fascinating new language ($1000 for 8080 systems). I've ordered manuals, and will report on what I find out.

DDJ is great; things like your floating point routines for the 6502 (which MOS Technology did not have available) really help.

Design for the future! In 5 years your home computer will be a 64K memory, 16 bit dynamically micro-programmable processor, four billion bytes of fast mass storage, and goodies I can't imagine.

Keep up the good work.

Martin Buchanan  
2040 Lord Fairfax Rd.  
Vienna, VA 22180  
(703) 893-7978  

HI is a family of general purpose programming languages designed in 1976 by Martin Buchanan. TINY HI (TINY) is the simplest version of HI designed, and will be implemented on the author's IMSAI 8080 system when I find the time.

TINY is a hybrid interpreter-compiler running on a dedicated virtual machine with virtual memory. TINY is completely structured. There are no GOTO statements or labels. There is no COMMON or RETURN; procedures have one entrance and one exit. TINY is a debugging translator, insuring that variables are defined, monitoring subscript range, etc.

TINY supports two data types, INTEGER, and STRING, and one data structure, the vector. Memory is allocated dynamically, and data type is determined at execution time, or by context, eliminating declarations.

The simplicity of TINY syntax, the small number of well defined operators, the ability to manipulate vectors, convenient input-output, and flexible commenting and mnemonic naming facilities, all combine to make TINY a very clean, easy to learn and use, language.

In the examples below, both interpretive sessions and programs are excerpted. TINY outputs are underscored. \+ is used to indicate a carriage return.

Arithmetic:

Numbers in TINY are integers: \(-2^{15} < i < 2^{15}\)

4 infix arithmetic operators are defined:
+ addition
- subtraction
* multiplication
/ division

Division by zero or overflow will produce an error message.

1 prefix arithmetic operator is defined:
- subtraction

Negation cannot produce an error.

The hierarchy of operators in TINY is:

highest ( ) [ ] nesting or subscripting
< (Blank) concatenation
# (number) - (negation)
* /
+ -

lowest = < > <= >= <<

Expressions are evaluated from right to left.

Vectors:

Numbers may be concatenated to form vectors:
A + 1 2
A + A 3 4
A

The left pointing arrow, +, is assignment. Any expression standing alone on a line is output. Vectors of
equal length may be combined in expressions:

\[
\begin{array}{c}
1 \ 2 \ 3 \ + \ 4 \ 5 \ 6 \\
5 \ 7 \ 9 \\
\end{array}
\]

Vectors of length one may be added, subtracted, etc. to another vector and be "distributed":

\[
\begin{array}{c}
1 \ + \ 4 \ 5 \ 6 \\
5 \ 6 \ 7 \\
\end{array}
\]

The prefix operator \# (number) returns the number of elements in a vector or string:

\[
\begin{array}{c}
\#5 \ 73 \ -1 \\
3 \\
\end{array}
\]

Both integer vectors and character vectors (strings) are limited to 255 elements.

Strings:
A string is a sequence of characters, other than ",", enclosed in quotes:

"THIS IS A STRING"

A string may contain no characters:

"" /* the null string */

Strings may be concatenated:

A ← "JOHN"
B ← "AND"
C ← "MARY"
A B C
JOHNANDMARY

Subscripting:
Vectors and strings can be subscripted by integer expressions:

A ← "ALGEBRA"
A[5 \ 1 \ 3 \ 2]
BAGL

Note that: \(x[i \ j \ k]\) is equivalent to:

\(x[i] \ x[j] \ x[k]\)

Global variables:
Globals are available to all TINY programs, and normally exist before and after program execution. I/O devices, data files, programs, and convenient system constants (.TRUE.) are all good globals. All variables defined in the interpreter are globals. Globals are distinguished by use of the period prefix when referenced:

.SIN
.EMPLOYEE-FILE
.PRINTER

Programs:
TINY programs have only one entrance and one exit. Parameters are passed by location. Assignment to parameters is prohibited within a program. Programs can return vector or string values, and are invoked by use in
an expression. Sample program:

```c
BEGIN MOD (A,B)
    /*
    RETURN THE REMAINDER OF A/B
    */
    MOD ← A−B*(A/B)
    IF MOD<0
        MOD ← −MOD
END
END

BEGIN GCD
    /*
    USE EUCLID'S ALGORITHM TO FIND GREATEST COMMON FACTOR
    */
    IF X < Y
        T ← X
        X ← Y
        Y ← T
    END IF
    WHILE R > 0
        R ← .MOD (X,Y)
        X ← Y
        Y ← R
    END WHILE
    "GCD=" Y
END GCD
```

The program GCD has several unusual features. ?X ?Y forces the evaluation of the expression ?X ?Y, which inputs X and Y, without making any assignment. T ← deletes T, allowing the compiler to reuse the allocated space. As shown by END IF, END WHILE, and END GCD, “noise” may be added to END statements; normally this is used to indicate the structure ended. /* begins the reservation of all columns to the right of, and including */ for comments, until */ is encountered. In TINY it is easy to implement Gerard Weinberg's concept of placing comments on the right hand side of the page, to be covered during debugging.

The program as shown is unusual; except in introductory programming classes, main programs do not calculate greatest common factors; also the mnemonic name is inconsistent with the use of “greatest common factor,” rather than “divisor.” To rewrite the program as a function, it should also be changed so that the values of the parameters are not changed.*

*This change is now required for program correctness reasons.

BEGIN .GCF (XD,YD)
    /*
    USE EUCLID'S ALGORITHM TO FIND GREATEST COMMON FACTOR
    */
    X ← XD
    Y ← YD
    IF X < Y
        T ← X
        X ← Y
        Y ← T
    END IF
    WHILE R > 0
        R ← .MOD (X,Y)
        X ← Y
        Y ← R
    END WHILE
END .GCF
```

Flow of control:
TINY control is always based on an expression which is true or false, called a predicate. TINY does not include logical variables or operators. All TINY predicates are of the form:

```
<exp> <relational> <exp>
```

The two expressions must agree in type. Vectors or strings must be of equal length to be equal. The first element of a string or vector is most significant when evaluating a predicate; the last element is least significant. TINY has two basic control structures with a total of four variants:

Do one thing or another depending on a predicate; Repeat something until a predicate changes.

These structures are illustrated in the accompanying figures.

Input-output:
To output an expression, simply place it on a separate line. If a string expression, the string is output. Integers are converted to a 6 character string with leading zeroes replaced by blanks and any minus sign to the immediate left of the most significant digit. In output, concatenation between integer and string expressions is allowed:

```
"A+B=" (A+B)
```

To input a variable, anywhere, place a question mark before the variable. Input is free format. Input and output may be combined in one statement, like the INPUT statement of some BASICs:

```
"A=" ?A
A=37
```

Operating System (OS):
TINY is its own operating system. Users run on a dedicated machine (their own micro) or a virtual dedicated machine. Programs are automatically compiled when defined and recompiled whenever source code is changed. TINY will include access to a virtual machine level where relocatable and reentrant machine code may be written using an assembler. This level cannot be defined until subroutine linkages and data formats are defined in greater detail. TINY has a virtual memory; the user sees a single large homogeneous memory space. Files, programs, utilities, and system variables are all represented as global variables in this memory.

Conclusion:
I'd appreciate feedback about TINY design and implementation. My address is at the end of this article.

Program correctness:
It is straightforward to construct correctness proofs for TINY programs. Relevant features include:

- Restricted control structures;
- All programs have only a single entrance and exit;
- Programs return only a single structure;
- Parameters may not be altered by programs;
- No floating point arithmetic (10.0*1.0);
- External variables share a common name table, and must be explicitly indicated with the . prefix;
- The deletion feature explicitly delimits the range of
temporary variables;
The simplicity of the language.
These features do not
follow
from the desire for a
small language. GOTOs would be easy to add, and checking
for assignment to parameters will actually cost core. I
maintain that one should not add features to a language
indiscriminantly, considering only available core or CPU
time. Psychological factors can also make a language good
or bad. PL/1, APL, "SUPER FORTRAN", "BASIC PLUS"
are all baroque languages, whose descriptions occupy size-
able books and whose complete features are rarely mastered.

"I see a great future for very systematic and very
modest programming languages." - The Humble Prog-
grammer by E. W. Dijkstra

TINY LANGUAGE SUMMARY

Vocabulary: BEGIN END IF ELSE WHILE UNTIL

Computer Power and Human Reason
by Joseph Weizenbaum
W. H. Freeman & Co., 1976
300 pp. $9.95

This is a book that should be read by anyone seriously interested in or affected by computers, a recommendation that includes most of the population of the U.S. The broad interest of the book is indicated by its selection as a Book-of-the-Month alternate. Professor Weizenbaum is a talented man who has been doing impressive work in computer science for a long time. In this book he performs the difficult feat of humanistic perspective. Weizenbaum's central theme is that the range of human capabilities and concerns is both profoundly different from and immensely larger than anything a computer can do. Too many people in the Artificial Intelligence community of computer science research believe that there is no human activity that cannot eventually be done by a computer. Weizenbaum is strongly critical of this view; he rightly sees it as the worst kind of blind hubris.

Some quotes from the book give the flavor of Weizenbaum's arguments:

"What could be more obvious than the fact that, whatever intelligence a computer can muster, however it may be acquired, it must always and necessarily be absolutely alien to any and all authentic human concerns? The very asking of the question, "What does a judge (or a psychiatrist) know that we cannot tell a computer?" is a monstrous obscenity.

The theories—or, perhaps better said, the root metaphors—that have hypnotized the artificial intelligentsia, and large segments of the general public as well, have long ago determined that life is what is computable and only that. As Professor John McCarthy, head of Stanford University's Artificial Intelligence Laboratory said, "The only reason we have not yet succeeded in simulating every aspect of the real world is that we have been lacking a sufficiently powerful logical calculus. I am currently working on that problem."

Sometimes when my children were still little, my wife and I would stand over them as they lay sleeping in their beds. We spoke to each other in silence, rehearsing a scene as old as mankind itself. It is as Ionesco told his journal: "Not everything is unsayable in words, only the living truth."

In support of this central theme Weizenbaum deals with some necessary background material. He presents an explanation of the theoretical basis for the power of machine based information processing, including a treatment of Turing machines. These sections are not what I would call light reading, but attention to them offers even the lay reader considerable insight into computer functioning. Weizenbaum also has a fascinating theory about the existence of hackers (compulsive programmers). As one who enjoys periodic fixes of code-writing and debugging, I found this theory especially interesting.

Professor Weizenbaum has written a book of substantial importance. As man's information processing machines become ever more powerful and pervasive, it is vital that we use computers for human purposes, and not the other way around.

TUTORIALS FROM THE IEEE COMPUTER SOCIETY

Review of recent developments in both minicomputer and microprocessor technology.

Each chapter begins with a short section which introduces the topics to be discussed and also highlights the significant points found in the chapter. Topic headings include technological advances, microprogramming, mini-computer architectures, microprocessors, mini and micro computer system development, and interfacing and peripherals.—$12.00

Text includes an introduction by the instructors, J. Michael Galey of IBM and Richard L. Kleir of Browne and Ramamoorthy, Inc., and 19 papers on microprogramming in six general categories: introductory papers, microprogrammed architecture and languages, production of microprograms, emulation and direct execution, microprogram applications other than instruction execution, conclusions, and perspectives.—$12.00; $15.00 Hardbound

Minicomputer Realtime Executives, from COMPCON 74 Fall, September 9, 1974–208 pp.

Of central importance to the economic realization of minicomputer applications is the realtime executive. Applications such as data acquisition, process control, and communication, are briefly discussed to identify their needs in a realtime executive. The main elements of these executives discussed include memory management, scheduling, data structuring, file handling, interprogram communication, and control structures.—$15.00

Digest presents broad perspective of peripherals industry. Excellent preparation for students, generalists, and those who have not been working directly in the field. Topics include trends in computer hardware and remote terminal systems, magnetic recording technology, use of peripheral devices in remote systems, and future projections in hardware and software.—Microfiche only, $9.00

This tutorial includes an introduction to the major ideas of structured programming, and their theoretical and practical foundations; a detailed presentation of a major application program system, and a presentation of program development stressing the top-down evolutionary character of the process.—$12.00; $15.50 Hardbound

This tutorial covers the arca of network topology and communications media, network technology and its effect on network performance, resource sharing requirements and techniques, and new approaches to network performance measurement, network access and network management. The general approach enables presentation of terminology and concepts followed by specific examples. The presentation stresses breadth rather than depth, and in turn provides network novices with a firm basis for becoming better educated on specific topics.—$12.00

Send Order To: IEEE Computer Society, 5855 Naples Plaza, Suite 301, Long Beach, CA 90803
Dear Sir:

Aug. 23, 1976

I just received issue no. 7 and back issues 1-6 in the mail Saturday and spent all afternoon reading them.

Specific comments: Vol. 1, no. 4, pg. 4; and no. 6, pg. 6 refer to PASCAL as being developed by Niklaus Wirth—the language was actually developed by Niklaus Wirth and Kathleen Jensen. [Hmph! He never mentioned that when I took his compiler course at Stanford!] If you insist on dropping Kathleen’s name someone might accuse you of being sexist and . . . (by the way, it is just coincidence that everything published in DDJ so far has come from males, isn’t it?). [No. It’s the frustrating fact that we have yet to receive any manuscripts from women.]

It was mentioned that you were planning on writing a Small PASCAL [Nope. Just thinking of writing some design articles to encourage implementation of something better than BASIC]; two documents that would be very helpful are: The PASCAL ‘P’ Compiler: Implementation Notes, by Nori, Ammann, Jensen, and Nageli; and PASCAL-S: A subset and its Implementation, by N. Wirth. These are numbers 10 and 12 from:

Institut fuer Informatik
Eidgenossische Technische Hochschule
Clausiusstrasse 55
CH-8006 Zuerich, Schweiz

Institute for Information
Federal Institute of Technology
Clausiusstrasse 55
CH-8006 Zurich, Switzerland

PASCAL-S is the “semi-official” subset of PASCAL. It consists of one program subdivided into a compiler which generates code for an abstract stack computer and an interpreter which interprets this code for an actual machine. The abstract computer is organized as a stack, 2 stack indexes, a program counter, an instruction register, a program status register (and a DISPLAY array used to speed up the addressing mechanism).

You might also be interested in the PASCAL Users Group and especially the PASCAL Newsletter, which contains a lot of information about PASCAL implementations, programming, features, etc. The PUG address is Univ. Comp. Ctr., 227 Exp. Engr., Univ. of Minnesota, Minneapolis, MN 55455. If you do finish a PASCAL implementation, please write to the Editors of the Newsletter because they are trying to keep a complete listing of all PASCAL implementations (as far as I know, the PDP series are the smallest machines on which PASCAL has been implemented to date).

From Vol. 1, no. 7, pg. 10—you comment on VRAM: there’s another ringer besides the one you mentioned—unless this device meets the radiation limits of Part 15 of the FCC regulations, it’s an illegal television transmitting station. [Not applicable. Matrox VRAMs output video for a video monitor; not RF for television.]

Vol. 1, no. 6, pg. 40—In F. J. Dickey’s letter, he seems to equate structured programming with ‘lots of control structures.’ This seems to me to be precisely the opposite of the truth; one of the basics of structured programming is the use of only a few control structures. Structured programming usually involves the use of only three basic control structures: sequence, if-then-else, and loops (usually repeat-until or while-do form). In fact, one of the important events in the history of structured programming was the publication of a proof that all programs could be written using only these three control structures. I hardly consider three structures “a lot of control structures.” Perhaps Mr. Dickey was confused by PL/1, which he seems to consider as a simple structured programming language. PL/1 is most definitely not a structured programming language. Indeed, many advocates of structured programming have strongly criticized several aspects of PL/1.

Vol. 1, no. 6, pg. 28—Jim Day’s article on variable character spacing is very interesting and such a scheme would be quite useful in producing good looking output. However, this must be restricted to use on final, human oriented output; it can not generally be used for program listings, etc. Variable character width destroys the visual character of program, and makes it nearly impossible to determine in which column a specific word begins, which is a significant factor in most languages. [Not so. Most “good” languages are free field format.] There are many examples in computer literature of much confusion caused by typesetters who reset program listings with variable width character spacing.

I’ve noticed several comments on games in DDJ. While I’m more interested in systems tape software being published, I’m somewhat upset at the large number of computer people who seem to enjoy running down games. I think games are very important as logical exercises. The importance of games in developing mental capabilities has been frequently pointed out by people ranging from Albert Einstein to R. Buckminster Fuller. As an example, the main field of study of John Von Neumann, one of the developers of the digital computer at the Institute for Advanced Studies, was in Game Theory. Some very interesting commentary to real world affairs is contained in the introduction to Computers, Chess, and Long Range Planning, by Mikhail Botvonnik, a book that I highly recommend. [Agreed. But, then again, why not just play games for the fun of playing games?]

Thanks very much for your kind attention in wading through this lengthy letter.

Yours truly,

Jim Day
17042 Gunther Street
Granada Hills, CA 91344

“STM BABY & VIKING VISION”

Bob,

July 29, 1976

... Speaking of neat things, the STM BABY! computer-in-an-attache-case [STM Systems, Mount Vernon, NH 03057] is the neatest thing I have seen in a long time. Not just a computer but also an ASCII-plus-Greek keyboard, cassette interface, video display generator, ROM monitor, etc., with a loudspeaker for audio output! Now, if they could only cut the price to $500 instead of $850 for their 2K system. [Photos and write-up in August Byte, pp. 122-124].

JPL reports that the on-board Viking computer is working OK. I hope it keeps on working—the nearest customer engineer is probably in Helium City. As astronomer Carl Sagan pointed out recently, animals on Mars may sleep during daylight hours because of the uncomfortably high temperatures (~20 F) and harmful ultraviolet rays. No one thought to mount a spotlight on Viking to allow pictures of Martian nightlife. The Viking camera did spot what looked like an inscription on a nearby rock, though; when translated (where is John Carter now that we need him?) it will probably be found to read, “Vikings go home!”

Sincerely,

Jim Day

WAYNE GREEN TO START PUBLISHING KILOBYTE

John Craig, Editor—KILOBYTE Magazine
RFD Box 100 D, Lompoc, CA 93436, (805) 735-1023

Editor's Note: John Craig, the new Editor of the about-to-be KILOBYTE magazine, submitted this article to Dr. Dobb's Journal after a conversation with us. We are publishing it because (1) it gives some explicit information about what may be expected from the forthcoming magazine and (2) we wish to support active competition among the vendors of products to the computer hobbyist community. We believe that such competition in this free marketplace can do nothing but benefit the consumers.

Readers should not take our publication of this article as an implication of our endorsement or special support of KILOBYTE over any of the other excellent periodicals serving our community. We enjoy BYTE and Interface and what we have seen of Microtrek. We expect to be equally pleased with KILOBYTE and Personal Computing.

We would be happy to publish similar articles from the editors of Microtrek and Personal Computing. Our only requirement is that they contain explicit information and details about the magazine, along with the unbridled enthusiasm for his publication that should be expected from any magazine's Editor.

Well, Wayne Green [the original publisher of BYTE] has finally got around to doing it! The hobby community has been expecting him to start another magazine for quite some time ... and here it is ... KILOBYTE. If the name of this magazine brings about a reaction, don't worry about it, because you're not alone. The important thing is that it's a name you won't easily forget ... and besides, what's in a name? Your reaction when you read the first issue is what will really count. (And you certainly ought to plan on getting that first issue, because it will very likely become a collector's item in the months to come. Look at what happened to the last magazine Wayne Green started.) Never mind getting any of the following issues ... just get that first one!

Now, for the important question: "What will KILOBYTE have to offer that would make me want to shell out my hard-earned bucks for a subscription?" One of the most important areas we're going to cover will be basic articles concerning both hardware and software. This doesn't mean that KILOBYTE is going to be just a "beginner's magazine." Most of us are either hardware or software oriented and could use some good fundamental material in the "lacking" area which will bring us up to speed. And, when I say "good material", I mean just that. We're not going to be publishing articles of a dry, tutorial nature. If there's a hardware or software concept, or "lesson", to be passed on through the pages of KILOBYTE, it will be done using practical examples. The approach will not be one of, "This is how it is done ..." but instead, "This is why it is done a certain way." Hardware articles will be related to various applications and the software articles will be tied in with programming problems and situations. Needless to say, the person who is a beginner will benefit from KILOBYTE as though it were directed at him exclusively.

Another area which KILOBYTE will be covering is applications. We will take a good look at small computer applications in both the home (entertainment, education, etc.) and especially in small businesses.

The KILOBYTE Software Library will be one of our big efforts, and probably one of our big headaches. There's a tremendous need for a central distribution point for small systems software. Much has already been developed ... but it isn't getting around! We're going to be selling programs at a modest cost on cassettes with the author/pro-

(AS USUAL) ELECTRONICS HAS A PASSLE OF GOOD HARDWARE ARTICLES

The September 2nd issue of Electronics magazine carried the following articles (among many others):
"Conferences Close in on 16K Standards" (for 16K-bit RAM)
"Shortage of Field Technicians Looms" (training programs for minicomputer techs)
"Fiber-Optic Data Transmission: A Practical, Low-Cost Technology" (Gigahertz bandwidth, noise-free)
"PRM Decoder Replaces Chip-Enabling Logic" (Design details)
"Check List for 4,096-bit RAMs Flags Potential Problems in Memory Design"
"Microprocessors Dominate Scene at Sold-Out Wesccon"
"Character Generator Fits on One Chip" (Bipolar LSI gives 64 alphanumerics for CRTs and matrix printers)
Electronics is published by McGraw-Hill, Inc., Box 514, Hightstown, NJ 08520. Subscriptions are $12/year or $30/3-years in the U.S.

JIM DAY NOTES ...

Dear DDJ: September 8, 1976
I see that Martin Gardner has already reviewed Conway's book in the September issue of Scientific American. Note the ad on page 213 of the same issue, offering a FREE (for $1) GIANT CATALOG (64 pages) of computer stuff from Newman Computer Exchange, 3960 Varsity Drive, Dept. 23, Ann Arbor, MI 48104.
"Microprocessors Have Their Problems Too," by Jerry L. Ogden, on p. 35 of the August issue of Instruments & Control Systems, is an interesting user's-eye-view of the state of the art. But one should keep in mind that the criteria of the industrial user are not always those of the hobbyist or educator.
Another interesting item is "Things That Go Byte in the Night," on p. 38 of the August issue of Computer Decisions. While amusing, this bit of whimsy would probably be of more interest to readers of Creative Computing rather than a dignified, scholarly journal like PCC or DDJ.
Jim Day 17042 Gunther St. Granada Hills, CA 91344

grammer receiving a 15% royalty for his efforts. Hopefully, this will provide an incentive to some of those who have developed some good programs to share them (and make some good cash in the process).

Standardization is something else KILOBYTE will be tackling. There's no reason why a person shouldn't be able to buy a microcomputer which has standard plugs on the back for connecting his serial or parallel peripherals. The cassette situation is something which needs looking into, also. We've got the Kansas City standard for software exchange at a rather slow speed, but perhaps we need to come up with a standard for high-speed cassette operation, too. People sit around and talk about standardization all the time ... others write about how something should be done ... and then there are those who give seminars on the subject. The only way anything is ever going to be done about this (and other situations) is for the industry to get together and discuss it! Wayne Green and KILOBYTE will be working on this. The address is KILOBYTE Magazine, Petersborough, NH 03458. Be sure to include the "KILO ..." Subscriptions will be $12/year or $25/3 years ($2 at the news stand). It will be in circulation around the end of December.
BOOKSTORE

ACTIVE FILTER COOKBOOK

ADVANCED APPLICATIONS FOR POCKET CALCULATORS
Jack Gilbert. 1975. 304 pp. $5.95.

ADVANCED BASIC

ALPHA-NUMERIC MUSIC WITH AMPLITUDE CONTROL
Malcolm Wright. 1975. 23 pp. $2. Xeroxed.

BIOFEEDBACK: Turning on the Power of Your Mind

BIOFEEDBACK AND THE ARTS

BASIC

BASIC BASIC
James Coan. 1970. 256 pp. $3.95.

BASIC PROGRAMMING

THE BEST OF CREATIVE COMPUTING, Vol 1

BODY TIME

THE BUGBOOK I & II with INSTRUCTOR'S WORKBOOK
Rony, Larsen, & Braden. 1974. $16.95. 2 volumes + workbook.

THE BUGBOOK III

BUILD YOUR OWN WORKING COMPUTER
David L. Heiserman. 1976. $5.95.

CALCULATOR CALCULUS

COMPUTER LIBDREAM MACHINES

COMPUTERS & COMPUTATION

ELECTRONIC PROJECTS FOR MUSICIANS
Craig Anderton. 1975. 134 pp. $6.95.

FUNDAMENTALS & APPLICATIONS OF DIGITAL LOGIC CIRCUITS
Sol Libes. 1975. 192 pp. $5.98.

FUN & GAMES WITH THE COMPUTER

GAMES, TRICKS, & PUZZLES FOR A HAND CALCULATOR
Wallace Judd. 1974. 100 pp. $2.95.

GAMES WITH THE POCKET CALCULATOR
Thiagarajan & Stolovitch. 1976. 64 pp. $2.

GETTING THE MOST OUT OF YOUR ELECTRONIC CALCULATOR
William Hunter. 1974. 204 pp. $4.95.

INTRODUCTION TO MICROCOMPUTERS I & II

MATH WRITING & GAMES IN THE OPEN CLASSROOM
Herbert Kohl. 1974. 252 pp. $2.45.

MY COMPUTER LIKES ME WHEN I SPEAK IN BASIC
Bob Albrecht. 1972. 64 pp. $2.

METRICALLY YOURS
Helen Hunter and Paul Wallach. 1976. 70 pp. $2.95.

MY COMPUTER LIKES ME WHEN I SPEAK IN BASIC
Bob Albrecht. 1972. 64 pp. $2.

MICROPROCESSOR/MICROPROGRAMMING HANDBOOK

NEW MIND, NEW BODY; BIO-FEEDBACK: New Directions for the Mind
Barbara Brown, Ph.D. 1974. 523 pp. $2.50.

NUMBERS: SHORTCUTS & PASTIMES

101 BASIC COMPUTER GAMES
David Ahl, editor. 1974. 250 pp. $7.50.

ON THE SENSATIONS OF TONE
Herman Helmholtz. 1885. $6.00.

PRINCIPLES & PRACTICE OF ELECTRONIC MUSIC

PROBLEMS FOR COMPUTER SOLUTION
Gruenberger & Jaffray. 1965. $7.95.

PROBABILITY

PROFESSOR GOOGOL'S MATH PRIMER

PROF E. McSQUARED'S (ORIGINAL FANTASTIC & SATISFYING CALCULUS PRIMER)
Swann & Johnson. 1975. 111 pp. $2.95.

PROF E. McSQUARED'S, PART II
Swann & Johnson. 1976. 103 pp. $2.75.

PROGRAMMING PROVERBS
Henry Ledgard. 1975. 134 pp. $5.95.

PCC GAMES' PROGRAM LISTINGS
PCC. 1974. 31 pp. $2.

STATISTICS
D.J. Koosis. 1972. 282 pp. $3.95.

TEACH YOURSELF BASIC, Volumes 1 & 2
Technica Education Corp. 1970. 64 pp each. $2.95 each.

TTL COOKBOOK
Don Lancaster. 1974. 328 pp. $7.95.

TV TYPEWRITER COOKBOOK

II CYBERNETIC FRONTIERS

THE UNIVERSAL TRAVELER

WHOLE EARTH EPILOG

WHAT TO DO AFTER YOU HIT RETURN or PCC'S FIRST BOOK OF COMPUTER GAMES
PCC. 1975. 157 pp. $6.95.

List title and quantity for each item you wish to order. (Orders to be shipped within California require a sales tax remittance of 6%.) For orders less than $10, add $1 for postage and handling; for orders $10 and more, add $2. Send your order, along with your check or money order, to: PCC, Box 310, Menlo Park, CA 94025. Thank you.
