covering Model I, III & 4

Volume 2. No. 1. - Jan/Feb 1989 - \$4.00

Happy Birthday

Expanded Birthday Issue

36 pages of pure TRS-80

LITTLE ORPHAN EIGHTY

Well, the clock struck midnight and here we are in 1989. Happy New Year everybody. Much happiness and prosperity to all of you in the year ahead.

To the people who were with us last year, "Thank you for staying with us." To our new subscribers we say: "Welcome aboard."

The start of a new year might be a good time to clarify some concerns many new subscribers have voiced. They ask why TRSTimes only accepts 'calendar year' subscriptions rather than 'running' subscriptions; also, many have said that publishing 'one year at a time' gives the impression of instability.

To answer, let me first say that one of my many philosophies about life in general is that NOTHING IS FOREVER. Then, let me take you back a year or so in history and point out that this philosophy was generously proven by 80 Micro when they cut off support for the TRS-80 at the end of 1987, and again when they, a few months later, ceased publication altogether.

A few years earlier it was COMPUTER USER, BASIC COMPUTING and SOFTSIDE, all very fine sources of TRS-80 information, who just could not manage survival.

OK, so they quit publishing their individual magazines - I have no problem with that. What I do have a beef with, however, is that all four magazines were giving the impression of longevity by asking you to subscribe for 1 to 3 years in their LAST ISSUE. You just know that some poor soul forked over some hard-earned money for a subscription - and never received an issue. I find that distasteful.

Also, in the case of SOFTSIDE, their last 8-10 issues contained nothing but TRS-80 programs they had published in earlier issues - heavy indication of a severe case of BURNOUT.

I REFUSE to involve TRSTimes in these practices. If I find myself burning out, no longer having fun, the year will be completed with material written BEFORE the burnout, and publication will then cease. Now, since we only accept 'calendar year' subscriptions, all subscribers will get each and every issue coming to them. It is the fairest (and the only) way to protect subscribers, as well as myself, from the above-mentioned perils of computer magazine publication.

So, you see, it is not instability. Au contraire, it is STABILITY. TRSTimes will NOT take your money for issues going years into the future that might never be produced; instead, we only promise that TRSTimes will produce six timely issues in 1989 - and that we WILL.

TRSTimes in 1990 - will we continue?

If WE still have fun and YOU are still interested, we may just do it again in 1990. The decision will be announced in the September issue (2.5).

A TRSMAS STORY

Santa Claus, a devoted TRS-80 enthusiast, called about a week before Christmas to tell me that he would be dropping off a present on his way back to the North Pole from Palm Springs.

Sure enough, on December 15th he climbed down the chimney and left a large box under the TRSmass tree. Now, being a night person, I was still awake, so in no time at all I was busily tearing off the pretty paper.

Soon the wrapping was demolished and I opened the big cardboard box. Lo and behold, inside was a brand-new printer.

No, not just ANY printer, but the answer to my many prayers, a dream come true, the sure cure to the 'dot-matrix blues', a LASER PRINTER, an HP LaserJet series II. WOW!!

This little goodie had been on my list since TRSTimes began - and now good ol' St. Nick had come through - what a guy!!

I carefully removed the HP from the box and immediately felt intimidated. This thing came with 4 manuals, and it didn't look like any printer I'd ever owned before. It looked more like a medium sized copying machine. I had this nagging feeling that, heaven forbid, I would have to read the manuals.

Luckily, I found the one that said "Getting started with the LaserJet series II Printer" and I followed the directions step by step. Somewhere about 4 A.M. I had it set up and plugged in, ready for action.

To make a long story (and night) short, let me just say that, the minute I saw the first printout, I was sold. This was the way I wanted TRSTimes to look.

At this point the January issue was finished, except for three pages (this page, the Index, and the back cover), ready to go to the printer for mass copying. BUT the masters were done on a dot-matrix printer - and I had just seen a glimpse of heaven!!

Needless to say, I spent the remaining night hours reading the manuals, slept for a while, then got back up and started redoing the masters on the LaserJet, learning as I went along.

Obviously, I have much more to learn. Not only are there many new things to try, but somewhere, somehow, I lost the page numbers. I have no idea where they went; they just left! Yes, this issue does have page numbers, but they were pasted up with scotch tape; so if they are a little crooked, or maybe even completely out of sequence, BLAME MY WIFE - SHE DID IT!!

And now...

Welcome to the 2nd year of TRSTimes

HACKER'S HEAVEN

CONVERTING INFOCOM ADVENTURES

By John Fowler

Infocom announced in 1986 that it would no longer support the TRS-80 Models I, III and 4. While this came as somewhat less than a shock (I guess TRS-80 users must be getting used to it), it was a major inconvenience to Infocom players. Now, to play Infocom adventures, one would either have to visit a friend or buy a computer that is supported.

I don't accept either of these solutions, so after some research and a couple of lucky coincidences, I found a way to transfer 'Leather Goddesses of Phobos' from an IBM PCjr to my TRS-80 Model III. The technique I used should work on all normal Infocom adventures (but are there REALLY any NORMAL Infocom adventures?) at least until Infocom decides to change its data file format, which hopefully won't be for a while. While this file is written to explain how to transfer to a TRS-80, it may also work with other orphaned computers for which Infocom had previously manufactured. It all depends on whether you have a visible driver program. At any rate, read on, and if you wish to modify this file for your own computer, feel free to do so.

STRUCTURE

Before I get on to the method of transfer, let me talk a little about the structure of Infocom adventures. In other words, how does Infocom make its games so quickly for so many different computers at once?

Infocom authors always begin by writing their adventures for a "virtual machine," that is, a machine that does not exist in reality. I will refer to the code generated for the virtual machine as the data file. This data file is then transferred to the disk formats of the computers being supported.

Of course, the computers can't understand a word of the data file in itself. So the authors make for each machine a "driver program," designed to interpret the data file and translate it to the machine on which the adventure is to be used. The authors only have to make this driver file once, as long as they don't want to change virtual machines. So, to make a new adventure, all they have to do is transfer the data file to a disk format and the driver program to the same disk.

The method presented here is based on the fact that the data file, with a few exceptions, is always the same file, no matter which computer format it is on. Only the driver programs vary from computer to computer. So, if one has the driver program for a now-abandoned computer, and one finds a way to copy the data file over, one then has a version for his or her computer!

TRANSFERRING TO MODEL III/4

Model I users please be patient. I'll get to you soon enough. Read this section, however, because some of it applies to you.

The first thing one needs to run an adventure on the Model III or 4 (III mode only) is the driver program. Because the driver for these computers is the same on all TRS-80 Infocom adventures, any of them will do. The driver program is recognized by a /CMD extension on the name. For example, the driver for Hitchhiker's Guide to the Galaxy is HITCHHIK/CMD (and the data file is HITCHHIK/DAT, but we'll worry about that later). Transfer this driver to a blank, newly-formatted diskette, which may have a bare DOS on it as well.

This driver program knows which data file it is looking for by checking its own name, then sticking /DAT on it. So you will need to rename the driver to whichever game you are planning to transfer. For example, on Leather Goddesses of Phobos, you should rename your /CMD file to LEATHER/CMD.

Now comes the hard part. You need to find a disk format where the data file is easy to get at and transfer. Fortunately, Infocom is starting to take the copy protection off its games, so that the data files are visible from the directory and accessible by normal methods. The IBM version of LGOP is an example of a non-copy-protected disk with a visible, accessible data file (named LEATHER.DAT).

After you buy (yes: **BUY**; see **A NOTE ON PIRATING**) this version, you will need to transfer it from the foreign disk format to your own. Hypercross or Super-Cross/XT may do the trick, or even TRSCROSS if you happen to have an IBM handy. However, if you don't like buying software-translation programs and don't know how to do it yourself, you can use an RS-232 link between a friend's computer and your TRS-80. Name the file the same as your driver program except a /DAT extension. At 1200 baud, it usually takes 20-30 minutes to transfer the data file, meaning 80-120 minutes at 300 baud or 10-15 minutes at 2400. If you have a null modem and the computers right next to each other, you should use 9600, which means the file will be transferred in less than five minutes. 19,200 baud rarely works out.

Once you have the /CMD and /DAT files, you're almost set. But wait, there's one more thing. As a form of primitive copy protection, the /DAT file must have a password on it or the program will bomb out. This password is "SMC." An example command under TRSDOS 1.3 to assign this password to LGOP would be:

```
ATTRIB LEATHER/DAT (ACC=SMC,UPD=SMC,  
PROT=EXEC)
```

Do NOT put the password on the driver program.

Now type the filename of the driver program to execute. Tah dah! A program in TRS-80 Model III/4 format!

One note: to the best of my knowledge this will not work on Infocom's "Interactive Fiction Plus" stories, even if you have 128K! Infocom's decision to drop the TRS-80 series came before A Mind Forever Voyaging, so a TRS-80 Plus driver was never made. You can write a nasty letter to Infocom if you like, but I doubt it will do any good. Or, if you want a challenge (and I am talking CHALLENGE), you can try to make a Plus driver yourself. Don't get your hopes up on getting any help from Infocom, though.

TRANSFERRING TO MODEL I

To play the Infocom games not specifically for the Model I, you **MUST** have either a double-density modification or a hard drive. The reason for this is that Infocom data files are greater in length than 125K, while SSSD 35-track disk drives hold less than 90K (and no, you can't split the data file into two portions and stick them on different drives, unless you also want a CHALLENGE).

Because Model I Infocom data files are different from other kinds of data files, you will need a new driver. You should copy one from a Model III version, and then apply a few patches. Not having a Model I, I cannot test these patches myself. They are only cer-

tified to work under NEWDOS/80 version 2.0, however, and I make no guarantees or offers of further support.

First, get the driver program from a Model III version. If you don't have a double-density adapter, you will need access to a Model III or 4. Again, you can either use an RS-232 link or Super Utility Plus to get the file to one of your own floppies (this one is less than 90K, so it's okay). Now apply the following patches, taken by combining Northern Bytes Volume 6 Number 8 and Volume 7 Number 3. Using a zap program (like Super Utility Plus or SUPERZAP), change all occurrences of

(hex) '21 25 42' to '21 18 43'.

Also, in the first sector,
find '11 44' and change to '49 40'.

Now you need to get the data file and put the SMC password on it as described before. If you don't have double-density or 80-track drives, you'll need to put this data file on a hard disk, which I know has been done, but I can't offer any specifics. If you can, make the hard drive the master drive and transfer the driver program there as well. I'm afraid that without any experience on Model I's or hard drives myself, I cannot offer any more help than this.

A NOTE ON PIRATING

Infocom has a copyright on its data file as well as its driver program. This means that it is illegal to copy it even to another disk format on another computer, unless you own the supported copy to begin with. You might think Infocom deserves to have its copies pirated for dropping the TRS-80 in the first place, but before you pirate, remember this: Infocom has the right to change its data file format at any time. If you buy the supported copy, that makes Infocom happy because they make money without the expenses of supporting your computer system, so they are likely to keep the data file format around. However, if they suspect that anybody is taking advantage of their data file format by simply grabbing a friend's data file, they could easily change the format permanently, meaning that the TRS-80 would be almost hopelessly abandoned once again. If you like Infocom games, then Infocom should deserve your financial support. You might even want to write a thank-you note on your registration card for keeping the standard data file format.

Go ahead, buy the thing!

- Basic

LISTER

by Lance Wolstrup

Every so often I run across a public domain program that just, somehow, captures my fancy. LISTER/BAS is one such program. It was sent to me by a reader who needed help in correcting some minor, but very irritating errors. Since LISTER/BAS is short and uncomplicated, fixing the code took no time at all. In the process I fell in love with it.

LISTER/BAS is a simple 'pretty printer' program that will print out a Basic program saved in ASCII format. It features a 'header' which gives the name of the program being printed, as well as the date of the print-out (the date is shown on page 1 only). It also has a 'footer' which prints the page number. Both tractor-feed and single-sheet feed are supported. Another nice feature is that you can control the indentation of the left margin, thus assuring a nice print-out that can be hole-punched without losing portions of the code.

This program should serve as an example to ALL programmers, including myself. Code does NOT have to be long, intricate or fancy. Let's face it, the bottom line of all programs is: DOES IT WORK - does it do the job it was intended to do? If the answer is YES, then the program is GOOD.

The code to LISTER/BAS is not fancy; it is not intricate and it is certainly not long. It does, however, do the job. So, to the unknown author, out there somewhere, here's a tip of the hat from TRSTimes: "Well done".

HUNTING FOR BURIED TREASURE

Peeking & Poking Model 4

by Lance Wolstrup

By now it must be apparent that my favorite DOS is TRSDOS 6.2. Unfortunately there are two versions: the original 6.2.0. and the upgrade 6.2.1. I never took the time to transfer my 6.2.0. files over to the upgrade, so I am often working with the old version, which has a problem with the FORMAT utility. FORMAT/CMD in 6.2.0 does not prompt for the number of sides to format. It simply performs only single sided formatting. Not until 6.2.1. was the user given the choice of the number of sides to format. Very inconvenient, if you use the earlier version of the DOS and have upgraded to double sided drives.

Of course, the best solution is to change to TRSDOS 6.2.1., but if that is not possible (or in my case, too much trouble), let's modify the FORMAT utility to do what we want.

First, understand that FORMAT/CMD in TRSDOS 6.2.0. was **always** capable of formatting double sided diskettes. The all-wise author certainly included the routine to handle double sided formatting, but excluded the '# of sides' prompt and, as we all know, since the default is 1, the result is a single sided format.

This exclusion takes place in the FLAG\$ table, more specifically in LFLAG\$ at memory location &H75 (117 decimal).

LFLAG\$ holds the following pieces of information:

- | | |
|--------|--|
| Bit 0: | 1 = inhibit step rate question in FORMAT
0 = display prompt |
| Bit 1: | Not known at this time |
| Bit 2: | Not known at this time |
| Bit 3: | Not known at this time |
| Bit 4: | 1 = inhibit 8" query in FLOPPY/DCT
0 = display prompt |
| Bit 5: | 1 = inhibit # sides question in FORMAT
0 = display prompt |
| Bit 6: | Reserved for IM 2 hardware |
| Bit 7: | Reserved for IM 2 hardware |

The initial setting of the bits is: 00110001. From this we can see that bits 0,4 and 5 are 'on' so as to inhibit the step rate question in FORMAT, inhibit the 8" query in FLOPPY/DCT, and inhibit the # sides question in FORMAT.

Logic tells us that if we turn off bit 5, FORMAT/CMD should then ask us how many sides we want to format. There are many ways we can do this, but since this is a column dealing with PEEKing and POKEing, let's fire up BASIC and use it as the vehicle to modify DOS.

From BASIC type: **PRINT PEEK(&H75) (ENTER)**

Unless you have some IM 2 hardware (whatever that is) attached to your Model 4, BASIC will respond by displaying the value 49 on the screen. In other words, memory location &H75 holds 49. This value corresponds to bits 0,4 and 5 'on', while bits 1,2,3,6 and 7 are 'off'. What we need to do now is turn off bit 5.

If you remember the mini-tutorial on AND, OR and XOR from issue #1.1., you know that we can turn off bits by ANDing the PEEK value with a number where ALL the bits are on EXCEPT the bit (or bits) we want to turn off, and then POKEing this new number back into the original memory location.

Type this:

POKE &H75,PEEK(&H75) AND 223 (ENTER)

Now type: **SYSTEM (ENTER)** to get back to DOS so we can try out the double sided formatting capability.

Assuming you have a double sided drive :1, insert a blank diskette there and type:

FORMAT :1 (ENTER)

After you have answered the prompts for 'Diskette name', 'Mater password' and 'Single or Double density (S,D)', you will then be greeted with: 'Enter number of sides (1,2)'.

Type: **2 (ENTER)**

Answer the 'Number of cylinders' prompt and you are then formatting a double sided diskette from TRSDOS 6.2.0.

Should you wish to also be prompted for the Bootstrap stepping rate, the AND 223 from above should be changed to **AND 222**.

Be sure to **SYSGEN** your new FORMAT configuration before you turn the computer off.

See you in March.....

Disk Duplication & Conversion

(TRS-80, IBM, CP/M)

by Fred Blechman

I've been spoiled! After working for four years with my TRS-80 Model III and three years with my Sanyo MBC 555, my recently purchased IBM PC/XT Clone has been a disappointment in several ways - especially in the area of disk duplication. S-L-O-W! Gads, with all that memory (640K RAM), making disk copies should be speedy - but not with MS-DOS 3.2. The DISKCOPY A: B: command takes almost two minutes to copy a double-sided disk, and that's after loading in the DISKCOPY file to start with.

Also, converting data and text files from CP/M or TRS-80 disks to the IBM takes some special doing. This article, without getting overly technical, will discuss programs and techniques to speed up disk duplication. I'll also cover disk conversion - making disks that can be read by different operating systems.

Disk Duplication

Disk duplication involves making an exact copy of a disk. This can be to make a working copy of a purchased or "master" disk, or to make an archival copy to store, or to make a copy for sale or swapping. Let me make it perfectly clear that I'm not talking about pirating programs. The disk duplication programs I'll discuss will NOT copy protected disks! That's a whole other subject - and as a software originator myself, I'm not about to promote piracy.

Duplication in large numbers is required by software manufacturers, public-domain sources, and computer club librarians. Here the difference in duplication times is multiplied by the number of copies, and can translate to a very significant time saving. For example, a program to be described later for the TRS-80 saves almost three minutes on a copy - or almost an hour saved making only 20 copies!

Duplication is usually provided by the Disk Operating System (DOS). In the case of the TRS-80 Models I/III/4, the command BACKUP is used by most of the available DOS'es. For MS-DOS, the command is DISKCOPY. The awkward combination of FORMAT, SYSGEN and PIP used together provide the normal means for making duplicate disks in the CP/M operating system. I've forgotten the command used by the Apple II +/e/c; my brief experience with an Apple IIc was so frustrating (18 disk swaps to make a single copy!) I've tried to put it out of my mind. Special duplication programs, discussed later in this article, are available for most micros to speed the process.

Disk Conversion

Disk conversion is another matter entirely. Suppose, for example, you have a bunch of text and/or data files you've accumulated using a TRS-80 Model III, and now you have an IBM PC compatible. Rather

than retyping everything, you COULD use two modems, two telephones, two communication programs (and probably two computer operators) to transfer the programs via the telephone lines. Or, you COULD run a cable from the TRS-80 to the IBM PC if they are reasonably close to each other, and with an appropriate terminal program at each end perform the transfer. Both these methods are clumsy, time-consuming and error-prone compared to disk conversion.

Various techniques, programs and equipment exist for making a new disk from your original disk. The new disk is directly readable on the target computer. You just stick it in the disk drive and operate the computer as if that new disk were made on the target computer in the first place.

The basic problem is that different operating systems, and frequently different manufacturers within the same operating system, use disks with different sizes and formats. Most use 5-1/4" double-sided double-density formats these days, but older machines used single-sided or 8" disks, and some newer ones use 3-1/2" diskettes. The "format" defines the number of tracks, sectors and bytes-per-sector, plus various other parameters. In the CP/M world alone there are dozens of different, incompatible formats! ..

Fortunately, the IBM PC 40-track, 9-sector-per-track, 2-sectors-per-cluster, 512-bytes-per-sector, double-sided format of 360K (actually 368,640) bytes per disk has become a de facto standard. But even this is now being challenged by 720K formats used by the IBM PC AT and most 3-1/2" diskettes. So, disk duplication is copying a disk to be used on the same (or 100% disk-compatible) computer, and disk conversion is copying the INFORMATION from a disk to another disk in another disk format.

TRS-80 Model III and RAPIDOS

My first experience with disks was with my TRS-80 Model III. Compared to cassettes, the disks were so fast and convenient I was delighted - until I used the BACKUP command. Even with two disk drives (so no disk swapping was required), and even though the disks were only single-sided (about 184K), it took 3-1/2 minutes to make a diskcopy of a reasonably-full disk. The total time depended on how many tracks were used on the source disk, and whether the target disk was blank or pre-formatted.

This was very slow. I frequently had to make dozens of copies at a time of my AMBIZ-PAK of computer programs for Amway Product Distributors, and updates when Amway changed product prices. The time consumed making BACKUPS of my master disks could have been much better used.

Because Amway's product prices change frequently, and are used within my programs, I could not use a duplication service, since that typically involved a cost for a master disk and a minimum of 50 copies. More on duplication services later.

Then I discovered Rapidynamic Software's "RAPIDOS" for the TRS-80 Model I/III/4. (I don't know if Rapidynamic is still offering this program, but it should still be available from Recreational Mathematical Software, 129 Carol Drive, Clarks Summit, PA 18411 for \$30. Specify TRS-80 Model I, III or 4.)

RAPIDOS is actually a mini-operating system for the TRS-80, with FORMAT, BACKUP, DiRectory, KILL, LOAD and other commands. A special DUPLICATION section features a simple menu that allows you to FORMAT, BACKUP (onto an already-formatted disk), FORMAT and BACKUP, check display speed, or change disk parameters (number of tracks, diskette name, password or date). With RAPIDOS you can make a BACKUP to a pre-formatted disk in only 26 seconds!

I tested RAPIDOS by making a duplicate of a disk with 30 of its 40 sectors used. The BACKUP command in TRSDOS 1.3 formatted and copied the files on the disk in 3 minutes and 28 seconds, or 208 seconds. Using RAPIDOS, the same job, including formatting, was done in 38 seconds. That's a saving of 170 seconds (almost three minutes) per copy! WOW!

Another really useful feature of RAPIDOS is the "Display Speed" command. It runs the selected drive and displays its rotational speed (around 300 RPM) continually until you hit the BREAK key (which returns to the menu.) This allows you to adjust drive speed with a small screwdriver to get it right-on - and that's especially important with RAPIDOS, since it will not function properly with a drive running at over 302 RPM.

I no longer dread the time to make copies of my AMBIZ-PAK programs and updates, thanks to RAPIDOS.

TRS-80 Model III and Supercross

When I first started writing with my computer, most magazine editors required only printed text copy, which I provided with my dot-matrix printer.

No problem. My favorite word processor, to this day - even after exposure to many other available word processing programs - is ZORLOF.

Things changed. As more editors got computers and word processors, they began requesting the text on disk as well as hard-copy. In the early days, most were using WordStar on Kaypros or CP/M machines, so they asked for the text on a Kaypro disk (which most CP/M machines can be configured to read.) Hmmmm. Problem. I didn't use WordStar, and I didn't have a Kaypro or other CP/M machine. I needed disk conversion.

About this time PowerSoft began selling SuperCross/XT, a disk conversion program for TRS-80, MS-DOS, and CP/M, for use on a TRS-80 Model I/III/4. It was a blessing.

Using SuperCross I would make a Kaypro formatted disk on the upper drive of my TRS-80 Model III, and then transfer text files saved in ASCII by ZORLOF. A

real breeze! I never had an editor call with a problem reading the disk on their CP/M machine.

These days most editors want text files on an IBM PC compatible disk. I still use SuperCross regularly to supply editors with an ASCII file on an IBM PC-compatible disk - made on my TRS-80 Model III. I can't even estimate how much this simple-to-use disk conversion program has saved me in time and effort. I don't even want to think of the alternative of sending the text long-distance by telephone and modem.....

I've also had the occasion, using SuperCross, to create a Kaypro disk, with ASCII versions of my TRS-80 AMBIZ-PAK BASIC programs. This allowed an MBASIC programmer to convert my programs to CP/M for use on various machines.

IBM PC Clone and TRSCROSS

Somewhat like SuperCross, this PowerSoft program provides another way of "marrying" an IBM PC to a TRS-80 Model I (double-density), III or 4. In this case, the IBM is the "native" machine, and the TRS-80 disk is the "alien". The purpose is to allow you to read and write TRS-80 disks, so that you can use TRS-80 data, text and BASIC programs on an IBM, or transport data, text or BASIC programs from an IBM to a TRS-80. (BASIC programs need additional translation, but at least you can get the program between machines easily.)

TRSCROSS does not make CP/M disks, but SuperCross does. Therefore, if you have both an IBM using TRSCROSS and a TRS-80 Model III or 4 using SuperCross, you can manage to make just about any format!

Duplication Services

As special equipment has become available to make multiple high-speed disk copies, several companies have been formed specifically to provide mass disk duplication. The equipment is too expensive for the casual user. These disk duplication services can make copies of disks for IBM PC, CP/M, TRS-80, Apple and probably any other micro you'll run across. Some also provide conversion services.

However, the you must need 50 or more copies of a disk to make the cost reasonable. And all the copies will be exactly the same, so you must be sure your programs or data are exactly the way you want them.

Twice I've had the occasion to use duplication services, and I was entirely satisfied with the service both times. However, the first time I had a master and fifty copies made of my Programs/ Utilities Disk - and a user discovered an error I had made in one of the 56 programs. I had to personally change one line of one program on every one of those disks!

Prices change as competition, equipment and blank disk prices change, so I can't give you prices, but here are the two firms I had make duplicates:

(1) ALF Products, Inc., 1315F Nelson St., Denver, CO 80215. Phone: 303-234-0871. Small one-time mastering fee. Copy protection available.

(2) Cycle Software Copying, P.O. Box 444005, Eden Prairie, MN 55344. Phone: 1-800-642-7633. No mastering fee.

Conversion Services

Although SuperCross and TRSCROSS have the capability to make various disk conversions, you may not have the equipment or patience to go through this sometimes-confusing process. Several firms around the country specialize in making disks from one format to another, including differences in disk sizes.

Word processor conversions retain most formatting codes. Data base conversions and extractions are also available. Dealers use these services for customers upgrading from an older system, dedicated word processor or minicomputer. Software publishers don't have to stock every imaginable format, but can order "custom" disks for those customers with less popular micros.

Users can salvage programs from their older computers by converting the format used by their new one. Disk conversion can provide continued life for your favorite programs as you upgrade your equipment.

Other Sources

Now that you are more aware of disk duplication and disk conversion, you'll notice advertisements in the computer magazines (usually in the classified sections, or small display ads) offering these services. You can also check in the Yellow Pages of your local phone book under "Computers - Software & Services."

You don't have to be an expert to make duplicate copies or simple conversions. You do need to have the right software to make the job easy. However, if you need to do either of these functions in any quantity, or for odd-ball machines, go to someone in the business.

Can't Find Software For Your TRS-80?

THE FILE CABINET offers the LARGEST selection of PUBLIC DOMAIN software available at the LOWEST prices you will find!

Let The File Cabinet Add Muscle To Your Computer!

Each disk is crammed full of programs for your TRS-80 computer. Many of which can't be found anywhere else!

ANNOUNCING OUR LATEST CATALOG...

Orchestra-90 Files

OVER 75 DISKS OF MUSIC DATA FILES!

THE FOLLOWING CATALOGS ARE AVAILABLE:

MODEL 4 - \$5.00
HIGH RESOLUTION/READMAC - \$4.00
ORCHESTRA-90 - \$2.00

The File Cabinet

P.O. Box 322
Van Nuys, Ca., 91408

Catalog prices are refundable with your first order.

TRSDOS 1.3 CORNER

COPY THOSE TRSDOS 6, LDOS & DOSPLUS FILES BACK TO TRSDOS 1.3. WITH CPY/CMD

by Gary E. Campbell

**Requirements: Model 3, 4, 4p, 4d
TRSDOS 1.3/1.4/1.5 - EDTASM**

"CPY/CMD" is a TRSDOS 1.3 copy aid program that, without leaving the native 1.3 mode, can copy LDOS, DOSPLUS and TRSDOS 6 files over to a 1.3 formatted diskette. If you are lucky enough to have double sided drives, even those double volume files can be copied too! Yes, double sided disk I/O using TRSDOS 1.3!

"CPY/CMD" also has the ability to list other DOSes files to the video, printer, or both, in numerous manners.

"CPY/CMD" supports 6 different parameters. The first 3 (a-c) are very similar to the TRSDOS 1.3 library command "COPY".

- a) CPY SOURCE/EXT:D TO DESTIN/EXT.pass:D
- b) CPY SOURCE/EXT:D DESTIN/EXT.pass:D
- c) CPY SOURCE/EXT:D :D
- d) CPY :D
- e) CPY SOURCE/EXT:D (V,P,A,H,S)
- f) CPY

The source file must be a TRSDOS 6.XX, LDOS or DOSPLUS disk.

The destin file drive number (:d) must be a TRSDOS 1.3 disk.

Both the source and destination drive numbers are required.

The destination password is optional.

All source files, even protected system files, may be copied.

Examples 'a' and 'b' differ only by the optional 'TO' parameter. Note the source and destination filenames may differ.

Example 'c' will give the destination file the same name. Example 'd' displays all active LDOS, TRSDOS 6 or DOSPLUS filenames on the source diskette.

Example 'e' lists the source file, to the P=Printer, V=video, or P,V=both. The listing defaults to the video.

The A option converts the byte to a 7 bit ascii byte. It should be used when output is sent to the printer, so your printer does not receive bytes larger than 7Fh.

The H option converts the byte to 16 bit hex ascii notation. If the S or A options are not used, 8 bit bytes will be sent to the output device. This may be useful if you are echoing the output to your RS232. The S option slows the output. The ',' is optional. Note that when using example 'e', the @ key pauses, and the Break aborts output.

Example 'f' is a help function that displays all parameters supported.

Because of the length of this program, I must limit my comments about the program itself. This program does not work on NEWDOS, due to its non-conforming directory. CPY/CMD may work on other DOSes, and as no writing occurs on the source disk, it is safe to try it on other DOSes. Testing has been limited to single and double sided files on LDOS, TRSDOS 6.XX and DOSPLUS disks.

The first part of the program displays all source disk files. The main processing area, labeled "COPY" gives you an idea of what steps were required to copy a program.

First, the source and destination filenames, along with their respective drive numbers, are checked for syntax, and stored in the programs buffers for future reference.

Now, the program searches for the source directory (GETDIR). It does so by searching through tracks 15-25, sector 1, looking for bytes A2C4, the hash codes for BOOT/SYS and DIR/SYS. It also checks the DIR/SYS directory entry for a name match. It determines if the disk is single or double sided by the record size of the directory, and patches the DOS to be able to read the "second" side of the source drive if required.

After this the program converts the source filename to a 1 byte hash code.

The EXMHIT area examines the hit table (sector 1 of the source directory) for a hash code that matches the source filespec. If a matching hash code is found, a calculation is performed to find its relative position in the HIT table. This position is called the files DEC. (Directory Entry Code).

So far, the program has only examined the HIT table. Now, it has to find the source files directory entry. Using the DEC, the directory sector that contains the source file information can be calculated. As each directory sector may store up to 8 filenames, a further calculation on the DEC will result in knowing where the source file directory data is contained within the directory sector.

Next, the program reads the calculated sector into its buffer, and by adding the offset to the beginning buffer address, we can examine and process the source file directory information.

First, bit 7 of byte 0 of the files directory entry is examined. If this bit is reset, this flags that the entry is a primary entry. If bit 7 is set, this warns that this entry is an extended (a secondary) entry. Bit 4 of byte 0 is then checked. If the file is active bit 4 is set. If the file has been killed, this bit is reset. (Newer DOSes only reset this byte when killing a file, TRSDOS 1.3 zeros the entire entry).

As many different filenames may hash to the same "hit" code, the filename must be also checked for an absolute match. No checking occurs on the protection level of the file.

Next, the source files extents are examined and processed. Calculations on the extent bytes will reveal where the program is located on the disk, and how many consecutive sectors are stored together in one 'bunch'.

Now, the RDWRT area now takes over, processing the extent information, reading appropriate sectors, and then saving each sector to the destination file.

The program then loops through all 4 extents if necessary. If an extent contains FFFF, this marks the end of the file, and control is passed back to the main loop, closing the destination file. If all of the extents are processed without finding the FFFF bytes, the last 2 bytes are analyzed. These last two bytes mark if an extended directory record exists. An extended directory entry is another similar directory entry used to store information on further source file extents. If the first byte of these last 2 bytes are not FE, return is passed to close the destination file. If an FE is found, the last byte of the directory entry is saved. This byte represents the DEC of the source files extended directory entry.

The program then loops back to the DEC processing, to read and save more file sectors.

The source file search, examine and locate procedures are the same as how most DOSes search for, locate, and read a file.

Stay tuned next issue for more 1.3 fun! Your comments, ideas and questions regarding the TRSDOS 1.3 corner are welcome.

TRS-80 Software from Hypersoft.

NEW ! PC-Three TRS-80 Model III Emulator !

PC-Three is a new program from Hypersoft that lets you run LDOS 5.1-5.3, TRSDOS 1.3, NEWDOS 80 V2, DOS-Plus 3.5 & MultiDOS on a PC, XT, AT or similar machine. PC-Three emulates a TRS-80 Model 111 with its Z80 Microprocessor and 64K of memory. It supports the printer and serial ports and most of the functions of the floppy disk controller. To use it you must be the legal owner of a TRS-80 Model 111 DOS and either a copy of the MODEL4/111 file (on TRSDOS 6.2) or a working TRS-80 Model 111 or 4.

Runs on PC, XT, AT & compatibles and laptops with at least 384K of memory. ONLY emulates TRS-80 Model 111. Comes with a special version of PCXZ to transfer your disks to MSDOS. Depending on the type of drives on your PC you may need access to a working TRS80.

Price: (Includes 1 free Upgrade) Order #PC3\$109.95
Call our support number after 6 P.M. for special price for PC4/PCXZ owners.

Run Model 4 Software on a PC with PC-Four !

Now you can run your favorite TRS-80 Model 4 programs on a PC !. PC-Four is a program that makes your PC or Compatible behave like a 128K TRS-80 Model 4 complete with operating system. Z80 microprocessor that can run many true Model 4 programs such as ALDS, ALLWRITE, BASCOM, BASIC, C, COBOL, EDAS, ELECTRIC WEBSTER, FED, FORTRAN, HARTForth, Little Brother, MULTI-BASIC, MZAL, PFS FILE, PASCAL, Payroll, PowerMail, PROFILE, SUPERSCRIPIT, TASMON, VISICALC, ZEUS and more.

Runs on PCs, PS/2s, compatibles and laptops with at least 384K of memory. ONLY emulates Model 4 mode of Model 4. To use it you must transfer your old files to MSDOS disks using PCXZ or Hypercross.

Prices: Order #PC4 \$79.95 alone, #PC4H \$104.95 with Hypercross
SX3PCM4, #PC4Z \$119.95 with PCXZ. Available on 3.5" disk format.

PCXZ reads TRS80 disks on a PC, XT or AT

PC Cross-Zap (PCXZ) is a utility that lets you copy files to or from TRS-80 disks on a PC or AT. Transfers all types of files. Converts BASIC automatically, no need to save in ASCII first. You can also format a disk, copy disks, explore, read and write sector data, repair bad directories and much more. Supports: all double density Model I, 111 and 4 formats. Requires: PC, XT, AT or compatible. You must have at least one 5-1/4" regular or high density drive and 256K memory. Not for PS/2s: Order # PCXZ \$79.95
Exclusive ! - Only PCXZ lets you repair and modify TRS-80 disks on a PC.

Read CP/M CoCo & PC disks on your TRS80

Use HYPERCROSS to COPY files between TRS-80 disks and those from many CP/M and IBM-PC type computers on your TRS-80 I, 111 or 4/4P. FORMAT alien disks, read their directories, copy files to and from them, copy directly from one alien disk to another. Converts TRS80 BASIC to MSDOS or CP/M as it copies, no need to save in ASCII first. Formats supported: IBM-PC and MS-DOS including DOS 1.1, 2.0-3.2 Tandy 2000, single and double sided, 3.5 and 5 inch. CP/M from Aardvark to Zorba. CoCo format on XT+ version.

HyperCross 3.0 PC reads popular MSDOS 1.1-3.2 formats Order
SX3PCM1, SX3PCM3 or SX3PCM4\$49.95
HyperCross XT/3.0 reads 90 different CP/M and PC formats Order
SX3XTM1, SX3XTM3 or SX3XTM4\$89.95
HyperCross XT/3.0-Plus. Reads over 220 formats inc CoCo Order
SX3XTM1+, SX3XTM3+ or SX3XTM4+\$129.95
Specify TRS-80 Model I (needs doubler), 111, 4/4P or MAX-80. Dual model versions e.g. Mod 3/4 on one disk add \$10 extra.

Other TRS-80 Programs

HYPERZAP 3.2G Our ever popular TRS80 utility for analyzing, copying, repairing and creating floppy disks of all kinds\$49.95
MULTIDOS 2.1 New for 1988 for 1 or 3 \$79, 64/80 for Mod 4(3)\$89
Mysterious Adventures - Set of 10 for M1, 3 or 4(3) complete\$49.95
TASMON debug trace disassemble TASM1 TASM3 or TASM4 \$49.95
TMDD Memory Disk Drive for NewDOS 80/Model 4 users \$39.95
XAS68K 68000 Cross Assembler, specify Mod 1, 3 or 4\$49.95
ZEUS Z80 editor/Assembler for Model 1 3 or 4 \$74.00
ZIPLOAD fast load ROM image, DOS & RAMDISK on your 4P \$29.95

We have more ! Write or call for complete catalog.

Tim's PD Express

by Timothy Sewell

Congratulations!

We have made it to a second year of TRS-Times!

I thank you for the support and encouragement over the last 6 issues and I hope to meet your expectations and keep up the quality of information you have come to expect and enjoy.

Before we get to the "meat" of this month's column, let's get the plugs out of the way first... The Big news this month is that The File Cabinet's ORCHESTRA-90 music file catalog is now ready to ship. Its more than 75 disks are crammed full of music files that are compiled and ready to play on your computer with the Orchestra-90 music synthesizer module. Be sure to make The File Cabinet your prime source for Orchestra-90 Music files!

There are still some issues of CLOAD magazine that are missing from my reference collection. March 1978 through October 1978 as well as November and December 1983 are missing. If you can provide information to the whereabouts of these elusive CLOAD Cassettes, please contact me.

The SOFTSIDE disk/cassette reference collection is almost complete as well. I am still looking for October 1978 through December 1978, and September 1979 through January 1980. I am also looking for ANY of the SOFTSIDE adventure series disks/cassettes (You

wouldn't believe how much of this stuff shows up as Public Domain!).

Now that the plugs are out of the way, let's talk about something that is on the minds of many of the people who write to me... What is the best communications program to use for the Model 4?

There are several available to you but the two that stand out are XT4 by Bill Andrus and FASTTERM by Mel Patrick.

XT4

XT4 is the program that I suggest to people who are just starting out in the communications hobby. It is a simple yet powerful program that is easy to use and can be learned quickly. By depressing the BREAK key anywhere in the program, you get a menu functions available to you so that you can configure the program to your individual needs.

The most powerful feature of this program is its automatic dialing function. With this feature you can store and retrieve up to 99 different phone numbers and have them all pre-configured for dialing. The program will also let you configure automatic log on sequences that a host computer will recognize and you can program macro keys that will issue instructions with a single keystroke.

XT4 also has a built in HELP feature that will explain every function that is available to you within the program. If you get stuck on a feature, use the HELP function. XT4 supports XMODEM file transfer (both CRC and Checksum) as well as ASCII buffer capture. If your Model 4 has 128K, the program will automatically use the extra memory as additional buffer giving you 84K of buffer space available.

XT4 also has the ability to configure to three of the more popular modems used with TRS-80 computers. It will automatically adapt itself via the Configuration function to Radio Shack Modems, HAYES and compatible modems, and the Model 4P internal modem. Many Model 4P users have said that this is a godsend!

The program comes with full documentation and all the files you will need to run the program. At this writing, I understand that Bill Andrus is no longer offering support for XT4. It was released under the SHAREWARE concept, but donations and responses were so poor that Bill sacked his Model 4 and went with the PC crowd (see what happens when you don't support SHAREWARE authors).

XT4 can be found on most Bulletin Board Systems and is available through The File Cabinet on disk MD4COM02.

FASTTERM

FASTTERM by Mel Patrick is for the more advanced user. In addition to many of the features mentioned in XT4, FastTerm adds SEVERAL enhancements that will make your BBS experience much more pleasurable.

FastTerm is window controlled. That is to say that it's various functions are available in windows that pop on to your screen without disturbing the existing data. The program can emulate several different types of terminals (VT100 is very popular), and one of the best features is a split screen mode that allows you to use the top two lines of the screen for typing a message before sending it to the host computer. This comes in very handy for conferences where several computers are talking at the same time. You no longer have to put up with on going messages screwing up your typing.

Another feature of FastTerm is the 1K Xmodem (sometimes known as Ymodem) file transfer protocol. This allows you to transfer files in 1K blocks rather than the standard 128 byte blocks of Xmodem. This can save a bit of time when transferring large files.

Other features that are a part of FastTerm include Area Code Search, logging of long distance charges, online time clock, and many others.

FastTerm is SHAREWARE and a \$15 registration fee to Mel Patrick brings a Printed manual and an updated disk with the latest release of FastTerm and well as other programs to try. The Shareware release of FastTerm does NOT contain full documentation though a simple help file is included to get you started.

Like I said, FastTerm is not recommended for the beginning communications hobbyist. If you do not register and obtain the manual, you will be lost when it comes to many of the advanced features.

FastTerm has gone through many modifications and upgrades over the last few months and it gets better with each release. The current version that I use is 14.5 and it does just about everything that I want it to do. The YMODEM transfer protocol saves you a bit of time and money when you download those huge Mac-Paint picture files. YMODEM is also available on GENie for faster file transfer.

FastTerm can be found on most TRS-80 BBS systems as well as The File Cabinet's library disk MD4COM13.

I have just received a new communications program called PCPLUS version 1.2 by Michael Bailey. I have not had the chance to try out the program but it's documentation states that it has a 208 number "in memory" BBS directory, unlimited changeable directories, unlimited macro keys, multi-dial up to 208 numbers, optionally linked BATCh files, expanded terminal operation, and animated graphics and sound displays.

I have not had the chance to explore this program as I have just received it, but you will hear about it when I am finished running it through the mill. Watch for it!

That just about wraps up this issue. I hope you all had a great holiday season and I wish everybody the best in the coming year.

Make Mine TRS-80!

STORAGE POWER

for your Model I, III, 4, 4P

•Hard drives complete from \$295.00

New & used 5 meg - 35 meg units - We do Internal III, 4 & 4P hard drives

Floppy upgrades - internal & external 360K, 720K - 3.5" drives

Model 4 - Basic

Cross reference your VISICALC files with

VCXREF4

by Fer Cornet

When a Visicalc worksheet increases in size, a Cross Reference utility is often needed to document the formulas used. Using the 'save to printer' option, <press /SS*PR>, described in the Chapter on the 'Print Command', you can print the worksheet entry position by entry position, from the lower-right entry to the upper-left entry, followed by format information. As each entry position takes one line, much paper is wasted when printing a large worksheet this way. In practice the need for listing is restricted to the entries containing the sometimes very complicated formulas. Labels and numerical constants are already so often documented as you printed an image copy of the worksheet just as it appears on the screen.

In 80-MICRO 5/84 I found a Basic Mod III program that selects from the Visicalc worksheet only the formulas for printing, thus saving a lot of paper. I converted the program to Mod 4 Basic, and discovered that by extending it, the program could be turned into an excellent Cross Reference utility.

Since a Visicalc file is saved to disk as a sequential file, and since sequential files are pure ASCII, the data can be handled with all the powerful techniques of string manipulation available from Basic.

The VCXREF/BAS program does not only give a listing of all formulas, but can now also execute a search for formulas in a specified rectangle. From a worksheet with upper-left field A1 and lower-right field BK200, you can restrict the search to for instance, C10 - H60. You can also restrict the search to a single formula, Visicalc command, arithmetic or logical function, operator or target-coordinate. So if you want to know all fields containing the function @COS(or all fields in which is referenced to the coordinate C10 the hunt will only be for such an item.

The report of the reference procedure will appear on your screen along with the number of matches. Specifying option P will do the same, but will also send it to the printer. The 'save to printer' option in Visicalc produces a listing starting with the field with the highest coordinate down to the field with the lowest coordinate, which is in my opinion rather illogical. VCXREF/BAS output is in the order from low to high.

A manual is not needed. I tried to keep it user-friendly by clear prompts and entry control routines. Many Remarks are also included to make the program self-

explanatory. As to the use of Basic it may be of interest to point to the following items:

line 300. STAMP\$ UPDATE SUBROUTINE.

I inserted this SBR which was published in 80-MICRO 5/87 and found it very helpful. It is a nice example of using VARPRT to change the contents of a string-variable.

line 30. TABLE OF CONTENTS.

If you are wondering why the lines are preceded by GOTO statements, the reason is that they change automatically each time that lines are renumbered or removed during development of the program. In fact the program itself jumps over the table of contents, so these GOTO statements are never executed.

line 100. PRINTER CONTROL.

Contrary to the model 3, where a memory address in the ROM is tested, testing of printer availability in model 4 is to be done on the status of the relevant IN/OUT Port.

```

Recreational & Educational Computing

Have you been missing out on the only
publication devoted to the playful connection
of computers and math?

The REC Newsletter features programming challenges
and recreational math, such as:

- the Magic of Schram 123 String
- the probability of an N game at Bingo
- time to complete a collection
- 6174
- Next Number in Sequence
- Locate the Bomb
- perfect numbers
- Fibonacci numbers
- prime number generation and contest
- self-reference and paradoxes
- self-listing program challenge and solution
- pi
- mystery programs explained
- probability
- Monte Carlo simulations

Also: Fractal art, the world's best card trick (based on
algebra), reviews of best software and books,
editorial, humor, cartoons, art, reader solutions,
and more!

Programs supported for:
TRS-80
Tandy
MS-DOS and others.

REC is available for \$24.00 per calendar year of 8
issues

ASSEMBLY 101

Z-80 WITHOUT TEARS

by Lance Wolstrup

Yes, I know, - I did it! I opened my big mouth and promised to teach everybody assembly language. I said something like: "It isn't that difficult." Certainly that is true, but then again "ain't nothing difficult, if you know how!" Realistically speaking, I cannot teach you anything about anything. There is only one person in the entire world who can do that: YOU.

Oh yes, I might be able to present the material in a manner which will shed light on the subject, BUT, it is up to you to do the learning. So, rather than your teacher, think of me as your very elementary tourguide into the world of assembly language.

Before we begin, let me say to anyone with assembly language experience who may be reading these articles that I do not intend to 'go by the book'. The 'book' has served only to confuse most beginners, so I am throwing it away. I will give only partial information when I feel it necessary, and in other instances I may be redundant if that suits the purpose. I will not be a 'byte miser'; that is, the code presented might be written shorter or, most likely, much more elegantly. Lastly, I will use my own terminology as I see fit, rather than the 'standard' words or names, if I think it advantageous.

In other words, this will be done MY WAY.

Now that I've covered my rear, let's cut the formalities and get on with the important stuff:
LEARNING ASSEMBLY LANGUAGE.

We will need the following:

1. Model I with TRSDOS 2.3B
or Model III with TRSDOS 1.3
or Model 4 in Model III mode with TRSDOS 1.3
(note: other DOSes may be acceptable;
however, no guarantees)
2. EDTASM from Radio Shack
(note: EDTASM from Apparat may be acceptable,
but only the RS version will be discussed)
3. A fair knowledge of BASIC programming.
(You need not be an expert, but a knowledge of the
'basics' of BASIC is essential.)
4. Willingness to learn, an open mind and, at least, 1
bottle of aspirin.

ASSEMBLY LANGUAGE VS. BASIC

Just as a musician already knowing how to play one instrument can easily learn to play another, a BASIC

programmer can learn another language. You already know the concept of programming - all you need to learn is the mechanics of the other language.

When you program in BASIC you deal with LINENUMBERS, COMMANDS, DATA and VARIABLES. You put these parts together in a logical manner and, voila, you have a program.

Assembly language does not use LINENUMBERS or VARIABLES; instead it uses LABELS, COMMANDS, DATA and REGISTERS (and physical MEMORY LOCATIONS).

BASIC has english-sounding commands that, for the most part, make sense. Assembly language has 2 or 3 letter commands (called OP-CODES) that, to a novice, will make no sense whatsoever. When explained, however, they will mellow out - somewhat.

Another important difference is that when programming in BASIC, you write AND execute the program from BASIC. Assembly language is written using an editor/assembler.

In our case we will use EDTASM which is actually two programs in one: it is a text editor AND an assembler.

First you use the editor to write your program, then you use the assembler to convert your instructions to machine code.

Your program CANNOT be executed from within EDTASM (or any other editor/assembler). You must return to DOS before your newly written program can be executed.

EDTASM

Like BASIC, EDTASM is a program. BASIC came with your DOS; EDTASM did not. It had to be bought from Radio Shack separately.

Since, at this point in time, you may have obtained this program from other sources, make a working DOS disk and copy EDTASM/CMD over to it. We are now ready to start.

Turn the computer on, insert the DOS disk with EDTASM on it and get to the 'DOS Ready' prompt.

Type: EDTASM (ENTER)

You are now in EDTASM and on the top portion of the screen you should see the copyright message. About a third of the way down the screen is an asterisk *. This is EDTASM's prompt for you to do something.

Quick recap:

BASIC prompts with 'OK'
EDTASM prompts with '*'.

Many options are now available and I will list the more important ones later, but for now let's take it one step at a time.

Since you haven't done anything yet, you have 4 commands available at this very minute:

Q (ENTER) - quit - back to DOS.

M (ENTER) - memory - display text used and available memory.

L filename/ext:dn (ENTER) - load an EDTASM source code file.

I linenum,increment (ENTER) - insert programming lines.

The (Q)uit command simply exits EDTASM and brings you back to DOS. Nothing difficult to understand here.

The (M)emory command is an aid to let you know how many bytes of text (program) you have used. It will also display how many bytes of memory is still available. At this point this is not an important command - we may never use it.

The (L)oad command brings in a source file that has been created previously by EDTASM. The syntax is: **L filename/ext:dn**.

If the extension is omitted, EDTASM will assume it to be /SRC.

The (I)nsert command is the most important command in EDTASM. It allows you to insert (write) your program. The syntax is: **I linenum,increment**. This works much like the AUTO command in BASIC.

Since I mentioned above that assembly language does NOT use line numbers, let me clarify why we all of a sudden are using them now:

EDTASM is part text editor and part assembler. When we invoke the I command, we are using the editor portion to type in our program. If we were perfect, we would never need to edit our program; but, alas, we are not, so the editor portion of EDTASM has built in editing commands allowing you to modify the text as needed. When you use these editing commands you must reference the text you wish to edit by its associated line number. This is the exact same concept as when editing a BASIC program. Incidentally, the editing commands themselves are almost identical to those you are so familiar with in BASIC.

Here, however, is where the similarity to BASIC ends.

BASIC also uses line numbers to reference a branch in the program flow; that is, you can GOTO or GOSUB to a particular line number.

You CANNOT do that in assembly language; instead the branching commands JP (GOTO) and CALL (GOSUB) must be told to branch to a particular MEMORY LOCATION.

Quick recap:

BASIC uses line numbers for editing purposes AND program execution.

EDTASM uses line numbers for editing purposes.

Assembly language does NOT use line numbers for program execution.

Now let's move on to see how the EDTASM editor expects you to type in a program. While the BASIC editor makes you type a line number followed by an instruction or series of instructions and pressing (ENTER) when you are done, EDTASM is a little more rigid. Here you can only type in one instruction per line, and it must be typed correctly over a span of four pre-defined 'fields'.

Field #1 is the LABEL field.

Field #2 is the COMMAND field.

Field #3 is the DATA field.

Field #4 is the COMMENT field.

An assembly language line will have this form:

LINENUMBER LABEL COMMAND DATA ;REMARK

for example:

00240 LOOP LD A,32 ;Chr\$(32) now in A

Quick recap:

The line number (00240) is NOT considered a field.

"LOOP" is the LABEL.

"LD" is the COMMAND.

"A,32" is the DATA.

"Chr\$(32) now in A" is the COMMENT.

(note that a comment must always be preceded by a semicolon.)

When you first use the (I)nsert command the cursor will sit one space to the right of the line number. This is the LABEL field.

Pressing the (RIGHT ARROW) key moves the cursor to the next field, which is the COMMAND field.

Pressing (RIGHT ARROW) again moves the cursor to the DATA field.

One more press of the (RIGHT ARROW) key moves the cursor to the COMMENT field.

Pressing (LEFT ARROW) moves the cursor to the previous field.

Quick recap:

(RIGHT ARROW) moves cursor to next field.

(LEFT ARROW) moves cursor to previous field.

OK, now that you know how to move the cursor, let's practice:

Type: **I 100,10 (ENTER)**

You have told the editor that you wish to start with line 100, and that each new line number should increment by 10. You should see the cursor sitting one space to the right of the line number 00100.

Now practice moving the cursor between fields right and left. Press (ENTER) a couple of times. Notice that the line number increments and the cursor is placed in the LABEL field of the new line.

When you are done, press the (BREAK) key. This gets you back to command mode and the asterisk prompt.

As you have inserted lines (even though they might be blank), we need to get rid of them.

When you want to get rid of everything you have typed in BASIC, you use NEW.

In EDTASM you use the (D)ELETE command.

Type: **D#:* (ENTER)**

This is shorthand for: DELETE first line to last line.

"#" means first line

":" is the separator

"*" means last line.

The EDTASM editor is now clear and ready for you to type in a new program. We will do that in just a minute. First, however, let's learn a little bit about Assembly language.

The TRS-80 models I, III & 4 are all built around the Z-80 chip which contains several REGISTERS used for manipulating data.

The word REGISTER may sound scary at first, but relax; think of them as nothing more than VARIABLES, almost like we use in BASIC. We can store numbers there; we can access the stored numbers there, and we can manipulate the numbers there.

These registers are named: **A B C D E H L**
(there are more, but for now we will concentrate on these seven.)

Each are 8 bit registers; that is, they are only capable of storing numbers ranging from 0 to 255.

When we have the need to access and manipulate numbers in excess of 255 we can combine registers B and C, D and E, H and L, thus making three 16 bit registers named BC, DE and HL. These 16 bit registers

are capable of handling numbers from 0 to 65535.

The A register (also known as the ACCUMULATOR) is very special. It is the only one of the 8 bit registers capable of performing math.

16 bit math can be done by using the HL register.

Notice that register A could not team up with a partner to form a 16 bit register. Actually, it does have a partner. It is called register F (the FLAG register), but it is used for another special purpose which we will discuss in a later installment.

If we can think of registers as being variables, then the following example will easily demonstrate the similarity between the two languages:

BASIC: A = 65
 or LET A = 65

Assembly language: LD A,65

Hopefully, we all understand the BASIC statement, A = 65.

Variable A now has the value 65 stored. You can now use the available BASIC commands to use this value in whatever way you see fit.

The Assembly language version, LD A,65, does the very same thing. It Loads the value 65 into register A, at which point you can use the available Assembly language commands to manipulate it any way you like.

At this point let's go back to when you first learned BASIC. What was the first thing you learned to do?
I'll bet it was something like:

10 PRINT "HI, I AM YOUR TRS-80 COMPUTER"

This was easy to understand because you could see the result on the screen.

The program can be modified to look like this:
10 A\$ = "HI, I AM YOUR TRS-80 COMPUTER"
20 PRINT A\$

It can be further modified to:
10 A\$ = "HI, I'M YOUR TRS-80 COMPUTER"
20 GOSUB 100
30 END
100 PRINT A\$
110 RETURN

Now, this may be a silly way to write a simple PRINT statement, BUT - this is how you write it in Assembly language.

The concept in BASIC is:
Store the text in a variable
Jump to the PRINT subroutine and print the text

The concept in Assembly language is:
Store the text in **memory**
Jump to the ROM PRINT subroutine and print the text
Very, very similar, isn't it?

We briefly discussed some of the editing commands that the editor portion of EDTASM understands (Q,M,L,I). The other half of EDTASM, the assembler portion, also has some special commands. These assembler commands (also known as PSEUDO-OPS) are very important, because they will be included in your code to tell the assembler to do certain things for you.

Here are, for now, the important ones:

ORG memory location - tells the assembler where to store your program in memory.

DEFM 'string' - (DEFINE MESSAGE) this tells the assembler that the characters inside the single quotes must be treated as ASCII text rather than extracting the numeric value of each character and then treating the number as a command or a piece of data.

DEFB value - (DEFINE BYTE) tells the assembler to treat this value as numeric data only.

END - indicates the end of the program. While BASIC does not require its use, Assembly language **demands** that the absolute last line of your program is the END statement.

Keep in mind that these commands are **ASSEMBLER COMMANDS**; that is, they tell EDTASM what to do when you assemble your program into machine code. They are not real Z-80 Assembly language instructions.

Quick recap:

The editing mode uses editing **COMMANDS**

The assembler mode uses assembler **COMMANDS**

Assembly language uses Assembly language **COMMANDS**

At this point may I recommend that you break open your bottle of Aspirin and, maybe, indulge in the beverage of your choice while you relax for a few minutes. Next stop: Writing a program.

GETTING DOWN TO BUSINESS

Let's expand on the Assembly language concept presented at the top of this page:

Tell assembler where to store program in memory
Define your text with the **DEFM** assembler command
Begin program

Jump to the ROM PRINT subroutine
Make program return to DOS
END program

The program will look like this:

```
00100      ORG 7000H
00110 MSG1  DEFM 'Hi, I am your TRS-80 computer'
00120      DEFB 0DH
00130 BEGIN LD  HL,MSG1
00140      CALL 021BH
00150      RET
00160      END BEGIN
```

Note: line 00140 is for **Model III only**.
Model I should substitute: **CALL 4467H**

Type this program into EDTASM, following these step by step instructions:

From the asterisk prompt type: **I 100,10 < ENTER >**

The cursor is now immediately next to **00100**
Press **< RIGHT ARROW >** once and type **ORG**
Press **< RIGHT ARROW >** once and type **7000H**
Press **< ENTER >**

Your screen should now display:
00100 ORG 7000H
00110

Line 00100 tell the assembler to assemble your program into memory starting (**ORiGinating**) with location 7000H, which is the first available location for user programs. DOS and ROM resides in the locations directly before 7000H.

The cursor is now located next to **00110**
Type **MSG1**
Press **< RIGHT ARROW >** and type **DEFM**
Press **< RIGHT ARROW >** and type **'Hi, I am your TRS-80 computer'**
Press **< ENTER >**

The screen looks this way:
00100 ORG 7000H
00110 MSG1 DEFM 'Hi, I am your TRS-80 computer'
00120

Line 00110 uses the **LABEL MSG1**. The **LABEL** could be any alpha-numeric combination of six characters or less, but **MSG1** is fine. The **LABEL** serves as a marker for the assembler. Any time we later refer to **MSG1**, the assembler will substitute the address of the actual memory the memory location. Next, we **DEFined** our **Message** as **Hi, I am your TRS-80 computer**. The **LABEL MSG1** now refers to the memory location containing the first letter of the actual text.

At line **00120** press **< RIGHT ARROW >** type **DEFB**
press **< RIGHT ARROW >** and type **0DH**
press **< ENTER >**

00120 DEFB 0DH

Line 00120 is a necessary evil. Because the ROM PRINT subroutine is written to quit only when it encounters a 0DH, we must end our text with that number, otherwise the routine will go off into the dreaded 'never-never land'. You are, in essence, telling the ROM routine that this is the end of the text and, since 0DH is also the code for a carriage return, to move the cursor to the beginning of the next line (0DH is 13 in decimal).

Continuing on line 00130 type the LABEL BEGIN
Press < RIGHT ARROW > and type LD
Press < RIGHT ARROW > and type HL,MSG1
Press < ENTER >

Now the line will appear this way on the screen:
00130 BEGIN LD HL,MSG1

Since line 00130 is the actual beginning of our program, we LABEL it as such. Then we LOAD register HL with the ADDRESS of MSG1.

LD is the assembly language command. HL,MSG1 is the data that the LOAD command will work on. It looks at MSG1, realizes that this represents a number, and then proceeds to store that number in register HL.

We can put any number we wish (0 - 65535) into register HL. In this case it suits our purpose for register HL to contain the memory address of where we stored our text. I'll explain why this suits the purpose when I talk about line 00140.

Let's do line 00140 now.
Press < RIGHT ARROW > and type CALL
Press < RIGHT ARROW > and if Model III type 021BH followed by < ENTER >
Model I should type 4467H followed by < ENTER >

Model III:
00140 CALL 021BH
or Model I:
00140 CALL 4467H

Line 00140 is THE important line of the program. It is the one that puts the text on the screen.

The Model III has a ROM routine that performs this task. It is located at memory location 021BH.

Model I uses a DOS routine located at 4467H for this function.

Both routines expect register HL to contain the address of the text to be displayed on the screen, which is why we did just that in line 00130.

CALL is like GOSUB in BASIC. As mentioned earlier, CALL does not branch a line number; instead it branches to the specified memory location. There it performs whatever action the subroutine provides and, when done, it returns to our program. The action at Model III's 021BH and Model I's 4467H takes the character at the memory address specified by HL and puts it on the screen at the current cursor position. HL is incremented by 1 and the cursor is moved to the

next position. HL now contains the address of the second character of our text. This repeats until HL contains the address of the terminating character (0DH). At this point the subroutine RETURNS to its caller (our program).

This brings us to our line 00150.

We have accomplished our goal of displaying the text, so we want to return to DOS.

At line 00150 press < RIGHT ARROW > type RET
press < ENTER >

00150 RET

Line 00150 issues the RETURN instruction. If we have done things correctly, and we have, this command will send us back to DOS.

You might think of our program, or any program for that matter, as sort of a subroutine called from DOS. When it sees the RET command it sends us back to the original caller which, of course, is the DOS command line.

There is much more to explain about RET, but we will do that in another installment.

Lastly, we get to line 00160.

This line is mandatory in all Assembly language programs and forgetting to include it will result in a one-way ticket to the dreaded 'never-never land'.

At line 00160 press < RIGHT ARROW > and type END
Press < RIGHT ARROW > and type BEGIN.
Press < ENTER >

00160 END BEGIN

The END statement should always specify a start address. You can use either the LABEL that specified the start of the program, in our case it was BEGIN, or you can specify the actual starting address; in our program it is 7000H.

At line 00170 press the < BREAK > key to get back to the EDTASM * prompt.

We have written the program and we now need to write it to disk. Let's name the program ASM1/SRC.

EDTASM's write-to-disk command is W.

Type: W ASM1/SRC < ENTER >

You have now saved the SOURCE CODE. Next we need to ASSEMBLE the program into an executable CMD file.

EDTASM's assemble command is A.

Type: A ASM1/CMD < ENTER >

You should see all kinds of weird things scrolling on your screen. In a few seconds, however, you should

see the following toward the bottom of the screen:
00000 Total Errors
BEGIN 701E
MSG1 7000

This tells you that you have made no errors, and that the labels MSG1 and BEGIN is translated into 7000H and 701EH respectively.

If you have made mistakes, type: **D#:* <ENTER>** and start over again.

If everything is correct, you can leave EDTASM by typing: **Q <ENTER>** which will bring you back to DOS. You can now execute you program by typing:

ASM1 <ENTER>

Now that you can display text on the screen, go ahead and practice with ideas of your own. Write a program that displays several lines of text, fill the screen with text, do anything you want, but whatever you do, keep practicing what you just learned.

Next installment will talk quite a bit more about displaying text on the screen. We will learn to POKE the screen from Assembly language, as well as position the cursor for PRINT@ text display, and more.

So until March.....Bye!!

EDTASM editor commands:

A	Assemble source in text buffer
D	Delete specified line or lines
E	Edit mode. Works almost exactly as the BASIC editor.
F	Find a specified string of characters in the text buffer
H	Hardcopy - print specified line or lines on the printer. H#:* <ENTER> prints entire listing
I	Insert source line or lines at a specified line with a specified increment
L	Load a source file from disk into text buffer
N	reNumber source lines in text buffer
P	Print to screen (LIST) specified line or lines of source code in text buffer P#:* <ENTER> lists all lines
Q	Quit - return to DOS
R	Replace specified line in text buffer Works like the Insert command, only the line is overwritten
T	Same as H, only no line numbers are printed
W	Write text buffer to disk
<RIGHT ARROW>	Cursor to next field
<LEFT ARROW>	Cursor to previous field
<UP ARROW>	Displays previous source line
<DOWN ARROW>	Displays next source line
.	Displays current source line

Copy Limited Files Under TRSDOS - LSDOS 6.X.

by Roy T. Beck

I recently purchased PFS:Files, and noted in the user's manual that it is limited to making 5 backup copies. At first glance this seemed a rather small number, and I was a little concerned in case I ran into trouble. (You never know!)

Being both noseey and cautious, I decided to enter into a little research project to determine as much as possible about operation with a copy-limited program.

The first step was to install a write-protect tab on the original disk. Sort of like AIDS protection. Next, I used one of the aftermarket copying utilities to make a verbatim copy without using up any of the five official copies.

This first copy I identified as disk #0. Disk 0 is a bootable disk, which turned out to have TRSDOS V6.2.0 on it.

I then proceeded to make copy #1, #2, #3, #4, and #5 from disk #0.

When I attempted copy #6, the DOS reported, "Disk contains protected files. Backup reconstruct invoked.", and then went on to make a copy.

I then attempted to boot all 7 disks, #0 through #6.

The first 6 booted properly and AUTO started PFS:File.

The last disk, #6, would bootup OK, and issue the AUTO command. But the DOS then responded with "File not found." A DIR check of the disks showed that #0 through #5 contained all the same files, but #6 was lacking two files; PFS/CMD and FILES/CMD. Obviously these are the protected files.

So far, the "5 permitted copies" seemed valid. BUT!

I next booted up with disk #1 and attempted to back it up to the freshly reformatted #6 disk. No squawks, it backed up just fine. And now #6 boots up PFS just fine!

So I continued with backing up from #1, and ended up with bootable PFS disks #6, #7, #8, and #9. These all booted PFS correctly.

#10 however, lacked the two protected files again.

Next I reformatted #10. I now went to disk #2 and repeated the process. This time I got three working disks, #10, #11, and #12.

I won't bore you with the repetitions, but instead will refer you to the chart below which reveals what is going on.

There is a counter on the original disk #0, initially set at 5. As each backup is done from this disk, the counter is first checked, and if not zero, decremented and a new backup made. This is a perfectly good, bootable disk with all files on it. The copy's counter matches the decremented value of the disk it is being copied from. Only when the source disk has decremented to zero does it complain and refuse to backup the protected files.

The table is constructed in the following fashion: Row A has only the original disk #0 in it. This disk is initially good for 5 copies, after which the counter is zeroed out. (Actually an FF is placed in the counter at that point, 0 never appears). The next row B has 5 working copies, #1 through #5. #1 is initially good for 4 copies, #2 is good for 3 copies, etc. Row C has good disks #6 through #15. Row D has good disks #16 through #25. Row E has good disks #26 through #30. The last row F has only one good disk, #31, for a grand total of 32 working disks, including the starting disk #0! As you descend down the table, each disk has one less permitted copy than the level above; the same is true as you move from left to right in the table.

It turns out that the number of disks, including the 0 disk is given by the equation $Q = 2^N$, where N is the number of "permitted copies". The limitation of "5" copies is really not so limiting after all, when you understand what is going on. Of course to make maximum use of the limited disk, you must make all of the 31 permitted copies initially before any are lost through inadvertance, bad machines, spilled coffee, etc. You need not be as systematic as the chart implies. Just keep backing up from each disk until the "Disk contains protected files." message appears.

Genealogy of a Copy Limited Disk

To carry the research a bit further, I next identified the counter in the protected disk. It is byte C6 of sector 2 of track 0. Initially this contained 5, but after each backup cycle it decremented once, except after 1 it

changed to FF, which is apparently interpreted as zero copies remaining.

Further testing all of this, I used Super Utility to replace the FF with a 5 and confirmed that the disk was once again willing to make more working backups. Byte C6 is part of BOOT/SYS, so evidently this copy limit scheme is inherent in TRSDOS 6.X, and probably was there from the earliest version 6.0.

This system works similarly to the one in TRSDOS1.3 (see Lance's article in TRSTimes V1N5P16). This counter is just in a different place, and does not show a zero when the copies are used up. By the way, TRSDOS normally has an FF at this byte, so I guess you could say that all copies of TRSDOS6.X are copy limited, but only for "protected" files, of which there are normally none.

The counter and protection scheme work in conjunction with a flag associated with the protected program(s). Other exploration has revealed that bit 4 of byte 1 of each directory entry serves as a flag to indicate the file is a copy protected file.

Simply resetting this bit to 0 via SuperUtility or equivalent will allow BACKUP to copy by files, including the file which originally had bit 4 set. There is yet more to be discovered, as clearing bit 4 does not suppress the message "disk contains protected files" which shows up during BACKUP. However, even though the message appears, the file WILL be copied, regardless of the counter in BOOT/SYS, and the program WILL execute.

As part of my search for the bit 4 flag, I perused Roy Soltoff's "The Programmer's guide to LDOS/TRSDOS Version 6" and located bit 4 as the likely candidate by carefully reading what RS had to say about the bytes and bits in the directory. Bit 4 stood out because the only explanation was "This bit is used internally by the system." A red flag if ever I saw one!

Some information also turned up in BACKUP/CMD. The copy limit can be turned off by PATCHing a piece of code. There is a relative jump which can be NOP'ed with 00 00, which will cause BACKUP to copy by sector as opposed to copy by file, and this will give you a verbatim copy regardless of the contents of the disk. In addition, the counter byte at C6 in the BOOT sector must also be edited.

The following patches will work for the DOS version as noted:

TRSDOS 6.2.0 and 6.2.1

PATCH BOOT/SYS.LSIDOS (D02,C6=00;F02,C6=FF)

PATCH BACKUP/CMD.UTILITY (D06,C3=0000;F06,C3=2807)

TRSDOS 6.3.0

PATCH BOOT/SYS.LSIDOS (D02,C6=00;F02,C6=FF)

PATCH BACKUP/CMD.UTILITY (D07,7B=0000;F07,7B=2807)

As a final bit of irony, the new utility included in TRSDOS 6.3, DISKCOPY/CMD, will do a verbatim copy of a disk, regardless of the presence of protected files, the counter, the bit 4 flag, or anything else I know of. SuperUtility can also properly copy the disk, except for the date/password structure under TRSDOS 6.3. It puts the old 6.2 structure in place, and you will have to use DATECONV to make the new disk kosher for 6.3.

WANTED:

Model III or 4

Permanently disabled woman looking for a Model III, 4, 4P, 4D.

**Any condition, priced reasonably.
Also, Tandon single or double sided drives.**

Would give your old computer a VERY good home.

Model I

INSIDE THE NEWDOS v.2.0.

SYSTEM COMMAND

by Ben Mesander

I have long been puzzled by the NEWDOS/80 SYSTEM command. It is hard to use, and requires a reboot to make any changes to the system options. This is especially annoying for people like me, who have Aerocomp Double-Density disk controllers, because the BOOT command does not work, and the computer must be reset manually.

On page 2-46 of the NEWDOS manual was the clue that I needed: the system parameters are stored in the 3rd sector of the diskette. What I wanted to do was find where these options were stored in memory so I could write programs that used them, but first, I found out how they were stored on the disk.

I used SUPERZAP to print a copy of diskette sector 2 (remember model I sectors start with zero). Then I changed the system parameters and printed a copy of the sector again. The byte that changed was the byte I wanted.

I found that the options were not stored in a particularly logical order. I then used DISASSEM to disassemble SYS0/SYS, and followed the boot-up code near 4D3EH, and sure enough, it was easy to find where the starting code read in the third sector into a buffer at 4200H.

The program reads in the sector, and stores the options in various places. I have not documented all the relevant locations, but just the ones I have used in writing programs. It's really very easy to find the others.

Please note that when you alter these locations, it is a temporary change that lasts until the next reboot unless you also change the third sector.

If you are wondering why anybody would like to change these parameters, I have included a very simple sample utility, A/MAC, that demonstrates their usefulness. It is written with Microsoft's M80 assembler, but it could easily be assembled with any other assembler, as it uses no fancy features.

The program allows the user to change the default drive number for the DIR command and the default drive number to create files on when no explicit drive is specified in the filename (system options AN and AO). This is something like the CP/M or MSDOS commands that allow you to "log in" a disk drive. In addition, the program makes sure you do not attach to a drive that does not exist, and it will also display the drive you are currently "logged into".

Once you have assembled the program, you use it as follows:

A # where # is a valid drive number on your system to "Attach" to that drive.

A with no drive number to display the drive number you are currently "Attached" to.

SYSTEM command options and their RAM locations:

AL(1)	439FH	Maximum drive number on system
AL(2)	477AH	These 2 are different location with the same information
AN	43A0H	Default drive for the DIR comand.
AO	43A1H	Default drive to create files on.
AP	4049H	High memory value.
AX	4370H	ASCII code of highest character to send to printer
BI	4501H	Cursor character ASCII value.

Internal NEWDOS data structures:

INBUF	4318H	Location of dos ready kbd input buffer.
ENTRY	4403H	Entry addr of m/l program (after loading).

A/MAC

```

Note: The following changes must be made in order for A/MAC to work with EDTASM:

Remove the **.Z80** instruction

Change **_SYSAL1** to **SYSAL1**

Change **_SYSAN** to **SYSAN**

Change **_SYSAO** to **SYSAO**

Remove the **ASEG** instruction

Remove **all colons** at the end of labels.

Change **DISPLAY** to **DISPLY**

Change **DRIVENO** to **DRIVNO**

Make sure **all** references to the above labels are also changed in the **operand** field.

ITEMS OF INTEREST

FOR SALE

My computer room has become so overstocked with program packages in my library that I have to clear some out to make room for things like sleeping and such!

These programs are all original and come with the original disks and documentation unless noted.

- They are being offered on a "Make me your best offer basis" (sort of like a mail auction).
- Offers will be taken until February 28th, 1989.
- Only people who have made the best offer will be notified.

Send your offers to:

The File Cabinet's Garage Sale

P.O. Box 322

Van Nuys, Ca. 91408.

Program Packages on DISK for the Model 4:

CP/M Plus Operating System - CBASIC for CP/M - Money Decisions 1-5 (make offer on complete set) - Formation - Deskmate - Accounts Receivable - Query (disk #2 is a backup reference disk) - Designe - Target Planner Calc - Data Ace - Double Duty - Disk Scripsit (disk is backup reference disk) - TRSDOS Training Course - TK! Solver - TRS-80 C - TRS-80 Pascal - Videotex Plus - TRSDOS 6.2 Utilities SuperScripsit - SuperScripsit Dictionary - Scripsit Pro

Program Packages on DISK for the Model III:

The Home Accountant (Continental release) - The Home Accountant (Radio Shack release). Disks are back up reference disks)
A.O.S. Utilities #1 - Agri-Calc Feeder Pig Module - Maxi Stat - Maxi Crass - PFS: Report - Blitzkrieg - Frogger - Computer Diplomacy - Planetfall - Spox - The Dean Vaughn Memory Course - Electric Webster Personal Income Tax Records Manager - Portfolio Data Manager - Domes of Kilgari - Trashman - Music Teacher - Kitchen Sink - Eureka - Geography Explorer: Mid East - Quikpro + II - RPM - Temple of the Sun - Voyage of The Valkyrie - Proof Edit - Superkeys - TRS-80 Compiler - Basic Network 4 Operating System - Visicalc - Profile III Plus - Alcor C - Corplan - Desktop Plan 80- Inventory Master - Data Master - Checkwriter 80 - Assembly Language Tutor - COBOL - Laser Blazer - Series-I Editor Assembler - Space Chase - Timetable - Home Budget - The Search For Elsolado - Earthquake San Francisco 1906 - Spook House/Toxic Dumpsite - System Diagnostic

Program Packages on CASSETTE for the Model III:

TRS-80 Basic course - Geography Explorer: Europe - Math-Pak-3 - Defense Command/Stellar Escort - Meteor Mission 2/Cosmic Fighter - Conflict 2500 - Adventure #0 Special Sampler - Sea Dragon -

Adventure #3 Mission Impossible - Rear Guard -
 Adventure #4 Voodoo Castle - Back 40 -
 Adventure #6 Strange Odyssey - Planetoids -
 Adventure #8 Pyramid of Doom - Project Omega -
 Adventure #9 Ghost Town - Escape from Traam -
 Adventure #11 Savage Island Part Two -
 Adventure #12 Golden Voyage - Showdown -
 The Time Dungeon-U.S - The Time Dungeon-World -
 Plotting Graphs for Line Printer - Business Package I -
 Plotting Graphs for Video Display -
 Mostly Basic-Interfacing/ Scientific -
 Mostly Basic-Household - Mostly Basic-Educational

This is just a small sample of what I have to offer. I have close to 100 TRS-80 oriented books that I will be offering soon. If you would like more information, feel free to drop me a line and I will let you know what I have to offer.

Color Computer II system for sale:

HARDWARE

Radio Shack Color Computer II - RS Power strip
 FD-501 Disk Drive Controller - 2 Floppy Disk Drives -
 Amdek Color 300 Monitor - Multi-Pak Interface
 Deluxe RS-232 Program Pak - TRS-80 X-Pad -
 Modem 1B DC-2212 Modem - Deluxe Joy Sticks -
 CCR-81 Data Cassette Recorder
 Botek CCP-2 Serial to Parallel

SOFTWARE

Cash Budget Management - Color Disk EDTASM -
 OS-9 1.01.00 - OS-9 C Compiler - OS-9 TRS-Copy -
 Coco Max - 10 disks of Public Domain Software
 including MIKEYTERM

ROM PACKS

Androne - Canyon Climber - Dungeons of Daggorath
 Galactic Attack - Spiderside - EDTASM +

MISCELLANEOUS

Program Pak File - Coco II Service Manual -
 Assembly Language Programming
 All cables and covers are included in this package.

**THIS SYSTEM IS FOR SALE
 AS A PACKAGE DEAL ONLY!**
 Items will NOT be sold individually.

Asking price is \$400 or best offer.
 Price does not include shipping.

SOFTWARE

PROGRAMS AVAILABLE FROM HINRICHS SOFTWARE:

The Basic Word Processor for Model I, III & 4/III

16K, 32K, 48K - tape or disk

Full featured, with wrap-around, font changes, global
 search/replace, form letters, etc.

Specify your system.

\$10.00 - tape - \$12.00 - disk

\$15.00 compiled (48K M1 disk)

Multivariable Regression Analysis Model I, III & 4/III

This is a 10-program disk-based package. It handles
 up to 9999 observations of up to 57 variables each.

Reverse stepwise operation on up to 47 variables.

Unlike some other such programs being sold, it is
 accurate. It will also print any outputs on a printer.

\$25.00

(simpler tape version - \$10.00)

Fourier Analysis and Synthesis

Determines cyclic variation in data, and will use
 significant cycles to forecast future data. Save data on
 tape or disk. Graphic & tabular output, and print on
 printer. \$10.00

FontPrint

Print my WP text files in SCRIPT, or in other fonts on
 Epson or DMP-type printers. FontPrint also supports
 block graphics and proportional spacing.

Model I - 48K disk only. \$10.00

Year's Data

Plot year's data of several variables on 8.5x11 sheet.
 Disk, MX-80, other printer with linespace control
 needed. Generates disk data file useable by regres-
 sion.

\$10.00

Mail List

Prints address labels or listing. Select the output by
 code, zip, name or number. Alphabetize.

\$10.00

Many other programs available.

ATTENTION ALL TRSDOS 1.3. USERS (Models III, 4, 4P & 4D)
DBSIDE ALLOWS TRSDOS 1.3. TO USE DOUBLE SIDED 5-1/4" DRIVES

Upgrades 1.3. to use DS/DD drives, by treating the "other" side as a completely new independent drive.

Up to 8 drives are now supported! It's like adding 4 new SS/DD drives!

SO GO OUT AND UPGRADE TO DOUBLE SIDED DRIVES! IT'S GREAT!

A new library command, "SWAP", allows disk drive numbers to be changed. Eg: After SWAP (1,2) is issued, the command DIR :1 <CR> would actually display drive two's directory! Even the SYSTEM DRIVE can be swapped with any other drive, allowing a data disk, or no disk at all, to reside in Drive :0

Many of the system overlay programs have been improved. A few of the improvements include restoring killed files, re-boot using "BOOT", debug ANY memory area/system files. BOOT/SYS, all system overlays, and DIR/SYS have been added to the directory. You can process/modify /examine any of these files, by using DEBUG, or even BASIC! Newly created files will now use an improved date format, being MM/DD/YY, instead of that old meaningless MM/YY format. And for you basic programmers, you can now execute DOS commands from within BASIC, and be returned to BASIC with all variables intact, even if DOS errors occur!

Send \$29.95 US funds, postage paid to: GRL SOFTWARE, Suite 209, 1051 KLO Road,
Kelowna, British Columbia, Canada, V1Y-4X6, Attn: DBSIDE

ATTENTION TRSDOS 1.3. USERS!
GRL SOFTWARE PROUDLY ANNOUNCES "SYSTEM 1.5."
THE MOST COMPREHENSIVE 1.3. UPGRADE EVER OFFERED!

MORE POWER!!!

MORE PUNCH!!!

MORE SPEED!!!

"SYSTEM 1.5." UPGRADES TRSDOS 1.3. TO USE THESE COMMANDS **

ALIVE = On/Off	Displays a moving graphic ALIVE monitor
TRACE = On/Off	Monitors the current STACK POINTER address
DATE = Yes/No	Enables/Disables the boot up Date prompt
TIME = Yes/No	Enables/Disables the boot up Time prompt
CURSOR = 'XX'	Defines the boot up cursor character
BLINK = Yes/No	Defines the boot up cursor status
CAPS = On/Off	Defines the boot up condition of CAPS lock
CONFIG = Yes/No	Save current configs/loads file during boot
DEVICE = Pr/Do	Outputs current active driver locations to?
TYPE (parms)	Adds a type ahead buffer with a "key click"
MEMORY = On/Off	Display BASIC free mem at all times
FILTER (parms)	Enables complete keyboard byte translation
FILTER (parms)	Enables complete printer byte translation
MACRO (parms)	Adds user defined MACRO KEY capability
SPOOL (parms)	*Enables a memory and/or disk LP spooler
SYSRES XX/All	*Select and store DOS overlays into memory
ADDLF = Yes/No	Adds a line feed after a 0DH is printed
IGLF = Yes/No	Ignores line feeds in those "OTHER" files
HARD = Yes/No	Sends 0CH to PR direct, instead of LF/LF/LF
PAGE = 'XX'	Starts page numbering on pg XX (DOS/BASIC)
FORCE = Yes/No	Forces new page after XX lines printed
UNKILL (parm)	Recovers/restores previously killed files
LIB/DVR	Enables DOS LIBRARY commands to be used by a BASIC PROGRAM without data/variable loss!

All options are installed using a new "SYSTEM (parm,parm)" command, similar to what LDOS or TRSDOS 6 users have had for years. For example, the type ahead driver is enabled, and the key "click" is defined, by using the command:

SYSTEM (TYPE=ON, TONE='xx',
LENGTH='xx', PORT='xx') <CR>

Enter graphics/special chars/comp codes from the keyboard, reconfigure the keyboard, speed up paging, add pg numbers, increase Disk I/O speed, link memory spooling to a disk, etc. So many added benefits, we just can't describe them all. The manual takes beginners step by step through each command, and a 'PRO' chapter documents drivers & tables.

* Model 4/4P/4D, (64/128K), except a 64K 4P, may use bank memory (16-32K for SPOOL/SYSRES options.

** Most options also support additional parameters. Eg: Spool parameters include options to alter or define ON/OFF status, buffer SIZE, select HI or BANK data storage, RESET buffer, DISABLE, ENABLE, DISK link, DISK SIZE, etc.

Send \$39.95 US funds, postage paid to: GRL SOFTWARE, Suite 209, 1051 KLO Road,
KELOWNA, BRITISH COLUMBIA, CANADA, V1Y-4X6. Attn: "SYSTEM 1.5."

Whew!!! Just met the deadline. This is the latest TRSTimes has ever gone to the print shop. We made it though, and it sure feels good. Do hope you like the new, sharper, non dot-matrix look.

Again, we could not hold the size to the scheduled 32 pages. Due to Gary Campbell's first installment of the TRSDOS 1.3. column we had to go the extra pages. This material simply could not be left out. Yes, it is a very long listing, but 'minor miracles' usually do take that much code. And, indeed, a minor miracle it is. You were always able to transfer files **FROM** TRSDOS 1.3. **TO** the other DOS'es via various built-in utilities, but never, never, never could you transfer files **FROM** the other DOS'es **TO** TRSDOS 1.3. Now you can. This is a 'first'. A big 'thank you' to Gary for sharing this outstanding utility with us.

(note to TRSDOS 1.3. users: Be sure to read Gary's ad for TRSDOS 1.4 & 1.5. on the previous page - there you'll find additional miracles at a low, low price.)

Another reason was my ASSEMBLY 101. Somehow, it ended up being more than twice the size I had originally anticipated. However, being a tutorial for beginners, I felt it important to take it one simple step at a time - and the length be darned. Future installments will be shorter, and the pace will be stepped up somewhat.

If you have ever played ZORK, or any of the other Infocom adventure games, we know you're hooked. John Fowler tells us how we can convert some of the games that were released for the IBM only, and make them WORK on the TRS-80.

Roy Beck researched and solved the Model 4 'backup limited diskette' problem. You can now make as many copies as you like.

The PD EXPRESS discusses two of the better communications programs. If Tim likes them, they are good.

Fred Blechman, who has written articles for almost every computer magazine ever published, graces us with a look at the world of disk duplication & conversion.

Fer Cornet from Holland gives us a fine cross reference utility for Model 4 Visicalc. This is good stuff. Don't miss it.

Model I is covered by Ben Mesander, a true 'old school' hacker of the finest order. He explores NEWDOS' SYSTEM command and includes a handy little machine language utility.

Hunting for Buried Treasure is my usual ramblings about TRSDOS 6.2. This time we focus on 6.2.0 and the missing double-sided format prompt.

Finally, I did not write LISTER. It is an obscure public domain program that is just too good to be ignored. It should work on all models. Try it, I'm sure you'll like it!

The March issue, hopefully, will have REAL page numbers. I will certainly do my best to find out what happened to them. Until then...STAY TUNED!!

The RAM software Company presents:

SMALL-C compiler version 3.0 on the TRS-80

A large subset of Kernighan and Ritchie C, with a UNIX compatible I/O library.

Many other library functions are included.
This is a true compiler, not a pseudo-code generator like some others.

REQUIRES that the purchaser own
Microsoft's M80 assembler and L80 linker,
or compatible assembler and linker,
on a 48K Model I with Newdos/80 version 2.0.
More than 1 disk drive is recommended.

\$20.00 for executable C compiler, library object code,
demo programs source code and C manual.

\$20.00 additional for source code to compiler library
and library building/management utilities +
documentation.

Make Checks/Money orders payable to:

Ben Messander
1137 E. Brooks St. Apt. 4
Norman, Oklahoma 73071
